Testing the Kerr Black Hole Hypothesis

Cosimo Bambi (Ludwig-Maximilians-Universität München)

5 June 2012, ESAC Madrid, Spain

LUDWIG-MAXIMILIANS-UNIVERSITÄT MÜNCHEN ARNOLD SOMMERFELD

CENTER For Theoretical Physics

Plan of the talk

- Motivations
- Theoretical and observational facts
- How can we test the Kerr-nature of astrophysical BH candidates?
- Continuum-fitting method (only for stellar-mass BH candidates)
- Jet power

Motivations

- Motivations
- Theoretical and observational facts
- How can we test the Kerr-nature of astrophysical BH candiudates?
- Continuum-fitting method
- Jet power

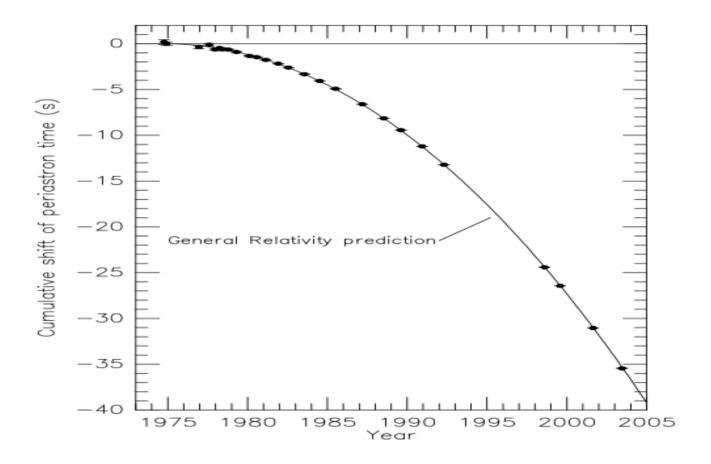

Tests of General Relativity

• Earth's gravitational field:

Lunar Laser Ranging experiments, Gravity Probe B, ...

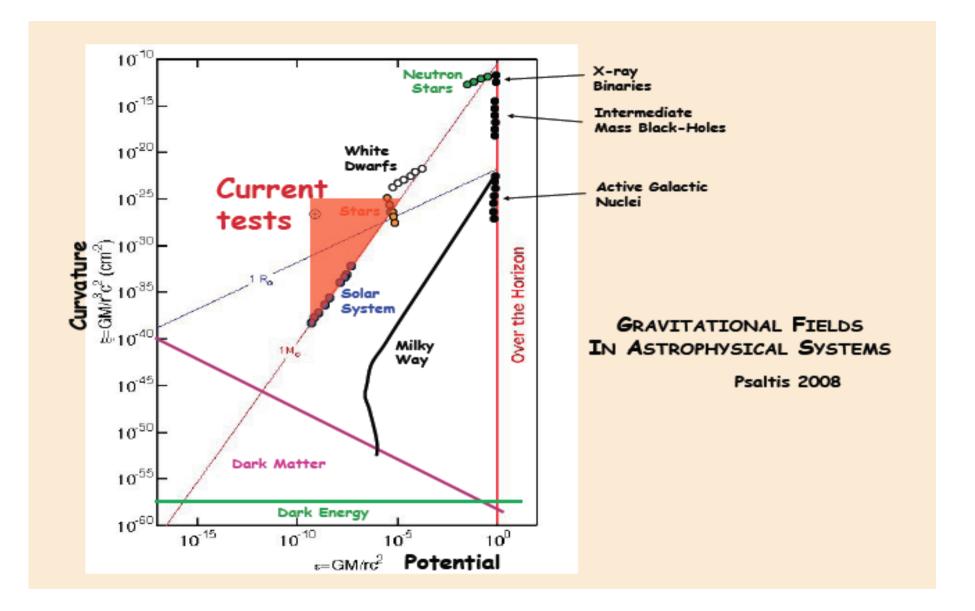

- Solar System:
 Cassini mission, . . .
- Observation of binary pulsars: PSR B1913+16, PSR J0737-3039, ...

Orbital decay of PSR B1913+16

From Weisberg & Taylor 2005

Cosimo Bambi (LMU Munich)

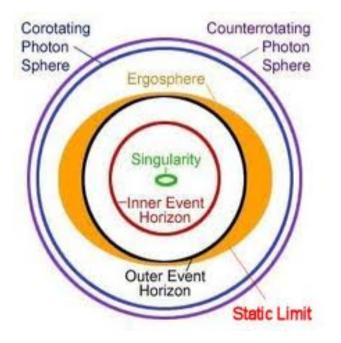

Theoretical and observational facts

- Motivations
- Theoretical and observational facts
- How can we test the Kerr-nature of astrophysical BH candiudates?
- Continuum-fitting method
- Jet power

Black holes in GR (Theory)

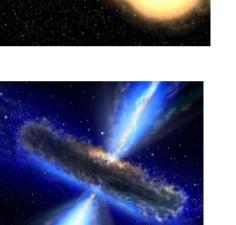

- Final product of the gravitational collapse \rightarrow Black hole
- 4D General Relativity → Kerr black hole
- Only 2 parameters: the mass M and the spin J ($a_* = J/M^2$)
- Kerr bound: $|a_*| < 1$

Black hole candidates (Observations)

 Stellar-mass BH candidates in X-ray binary systems (5 – 20 Solar masses) –

- Super-massive BH candidates in galactic nuclei (10⁵ 10¹⁰ Solar masses)
- Intermediate-mass BH candidates in ULXS (10² – 10⁴ Solar masses?)

Stellar-mass BH candidates

• Dark objects in X-ray binary systems

• Mass function:
$$f(M_{BH}) = \frac{K^3 T}{2\pi G_N} = \frac{M_{BH}^3 \sin^3 i}{(M_{BH} + M_c)^2}$$
 $K = v \sin i$

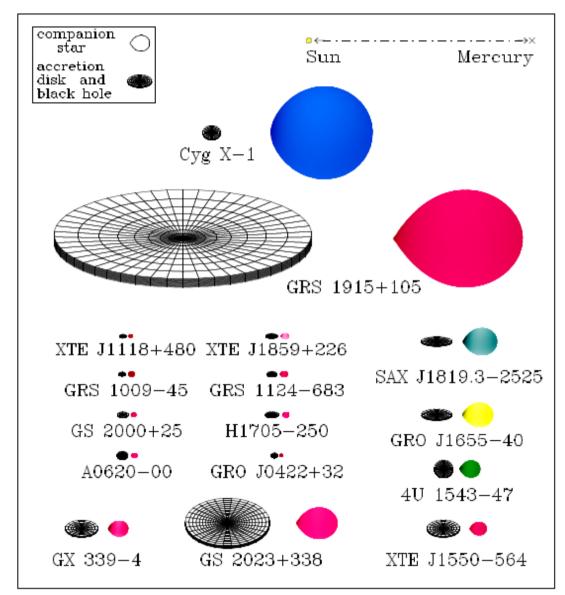

• In general, a good estimate of M_C and *i* is necessary

 Maximum mass for relativistic stars about 3 Solar masses (see Rhoades & Ruffini 1974 and Kalogera & Baym 1996)

From Remillard & McClintock 2006

Black Hole Binaries in the Milky Way

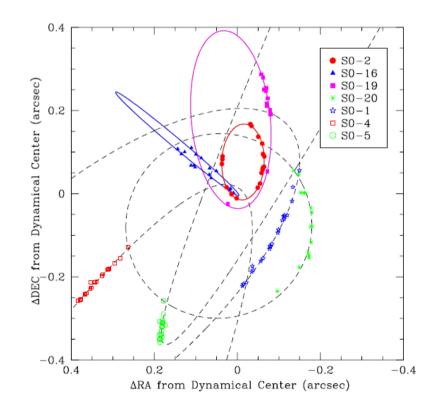

From Remillard & McClintock 2006

Cosimo Bambi (LMU Munich)

Super-massive BH candidate in the Galaxy

- We study the orbital motion of individual stars
- Point-like central object with a mass of 4x10⁶ Solar masses
- Radius < 45 AU (600 R_{Sch})

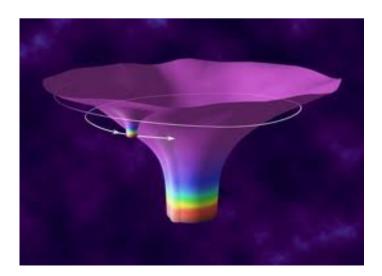

From Ghez et al., ApJ 620 (2005) 744

How can we test the Kerr-nature of astrophysical BH candidates?

- How can we test the Kerr-nature of astrophysical BH candiudates?
- Continuum-fitting method
- Jet power

Testing the Kerr BH Hypothesis with EMRIs

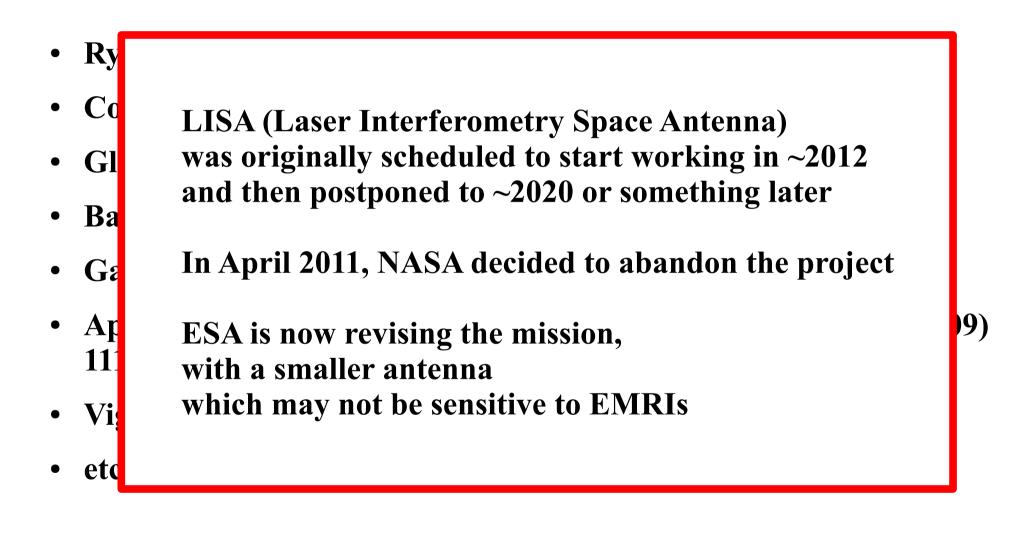

- EMRI = Extreme Mass Ratio Inspiral
- LISA will be able to observe about $10^4 10^6$ cycles of GWs emitted by an EMRI while the stellar-mass body is in the strong field region of the super-massive object
- The quadrupole moment of the super-massive object can be measured with a precision at the level of $10^{-2} 10^{-4}$

Testing the Kerr BH Hypothesis with EMRIs

Testing the Kerr BH Hypothesis with the radiation emitted by the gas of accretion

- Significant progresses in the last ~ 5 years in the understanding of the electromagnetic spectrum of BH candidates
- Spin measurements:
 - → Continuum-fitting method (stellar-mass BH candidates)

 \rightarrow Relativistic iron line (both stellar-mass and super-massive BH candidates)

- Some data are already available and more data will be available in a near future
- New VLBI experiments with unprecedented high-resolution imaging capabilities

Testing the Kerr BH Hypothesis with the radiation emitted by the gas of accretion

• BH Shadow:

Bambi & Freese, PRD 79 (2009) 043002; Bambi & Yoshida, CQG 27 (2010) 205006; Johannsen & Psaltis, ApJ 718 (2010) 446; Bambi, Caravelli & Modesto, PLB 711 (2012) 10

• Continuum-fitting method:

Bambi & Barausse, ApJ 731 (2011) 212; Bambi, PRD 84 (2012) 043002

• Relativistic iron line:

Johansenn & Psaltis ApJ 745 (2012) 1, arXiv:1202.6069

• Radiative efficiency:

Bambi, PRD 83 (2011) 103003, PLB 705 (2011) 5, PRD 85 (2012) 043001

Testing the Kerr BH Hypothesis with the radiation emitted by the gas of accretion

• Continuum-fitting method:

Continuum-fitting method

- Motivations
- Theoretical and observational facts
- How can we test the Kerr-nature of astrophysical BH candiudates?
- Continuum-fitting method
- Jet power

Continuum-fitting method

• The soft X-ray component of the spectrum of stellar-mass BH candidates is the thermal spectrum of a geometrically thin and optically thick accretion disk

Cosimo Bambi (LMU Munich)

Novikov-Thorne Model

- Geometrically thin and optically thick accretion disk
- Relativistic generalization of the Shakura-Sunyaev model

Assumptions:

- Disk on the equatorial plane
- Gas's particles move on nearly geodesic circular orbits
- No magnetic fields
- No heat advection; energy radiated from the disk surface
- Inner edge of the disk at the ISCO, where stresses vanish

 \rightarrow Efficiency = 1 – E_{ISCO}

Novikov-Thorne Model

- Geometrically thin and optically thick accretion disk
- Relativistic generalization of the Shakura-Sunyaev model

Assumptions:

• Disk on the equatorial plane

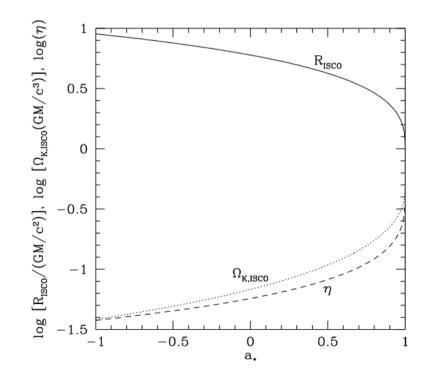

Selection criterion: $0.08 L_{EDD} < L < 0.30 L_{EDD}$

- Gas's particles move on nearly geodesic circular orbits
- No magnetic fields
- No heat advection; energy radiated from the disk surface
- Inner edge of the disk at the ISCO, where stresses vanish

 \rightarrow Efficiency = 1 – E_{ISCO}

Continuum-fitting method in Kerr background

- 5 parameters (BH mass, BH spin, BH distance, viewing angle, mass accretion rate)
- BH mass, BH distance, viewing angle → BH spin, mass accretion rate

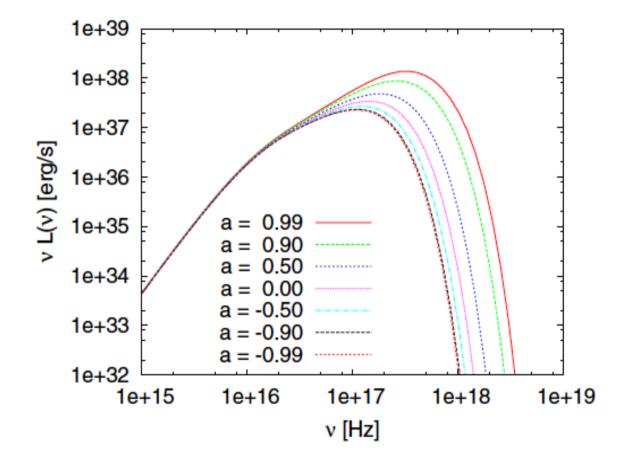

Mass accretion rate (Kerr background)

Testing the Kerr BH Hypothesis

- To test the Kerr-nature of an astrophysical black hole candidates we need to consider a more general background, which includes the Kerr solution as special case
- In addition to the mass and the spin, the compact object will be characterized by one or more "deformation parameters", measuring possible deformations from the Kerr geometry
- The Kerr black hole hypothesis is verified if observations require vanishing deformation parameters

Johannsen-Psaltis metric

$$\begin{split} ds^2 &= -\left(1 - \frac{2Mr}{\Sigma}\right)(1+h)\,dt^2 + \frac{\Sigma(1+h)}{\Delta + a^2h\sin^2\theta}\,dr^2 + \Sigma\,d\theta^2 - \frac{4aMr\sin^2\theta}{\Sigma}(1+h)\,dt\,d\phi + \\ &+ \left[\sin^2\theta\left(r^2 + a^2 + \frac{2a^2Mr\sin^2\theta}{\Sigma}\right) + \frac{a^2(\Sigma + 2Mr)\sin^4\theta}{\Sigma}h\right]d\phi^2\,, \end{split}$$

$$\Sigma = r^{2} + a^{2} \cos^{2} \theta,$$

$$\Delta = r^{2} - 2Mr + a^{2},$$

$$h = \sum_{k=0}^{\infty} \left(\epsilon_{2k} + \frac{Mr}{\Sigma} \epsilon_{2k+1} \right) \left(\frac{M^{2}}{\Sigma} \right)^{k}$$

Cosimo Bambi (LMU Munich)

Basic features of the code

• Geometry of the background:

Johannsen-Psaltis space-time (Johannsen & Psaltis 2011) with three free parameters – mass, spin parameter, deformation parameter. No restrictions on the values of the spin parameter and of the deformation parameter

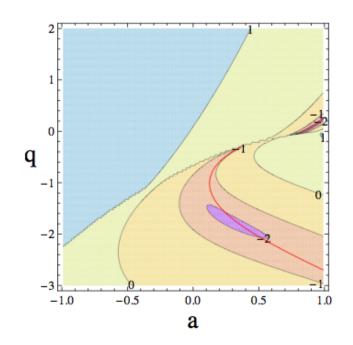

• Relativistic effects:

All relativistic effects are included. Ray-tracing technique used

- Self-irradiation: Not included
- Non-zero torque at the inner edge of the disk: Not included
- Color factor: Constant. Set by the user
- Radiation emission: Isotropic or limb-darkened

M33 X-7

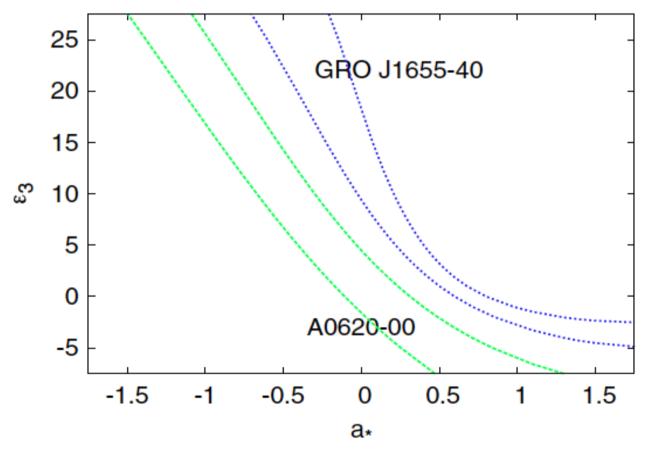

- X-ray binary system in the galaxy M33. Mass, distance from us, and inclination angle of the disk are known with good precision
- Chandra and XMM-Newton data in the high-soft state
- Spin parameter: 0.84 ± 0.05 (Liu et al. 2008, 2010)
- Allowed region in the spin parameter deformation parameter plane: work in progress . . .

From Bambi & Barausse 2011

Spin parameter – Deformation parameter plane

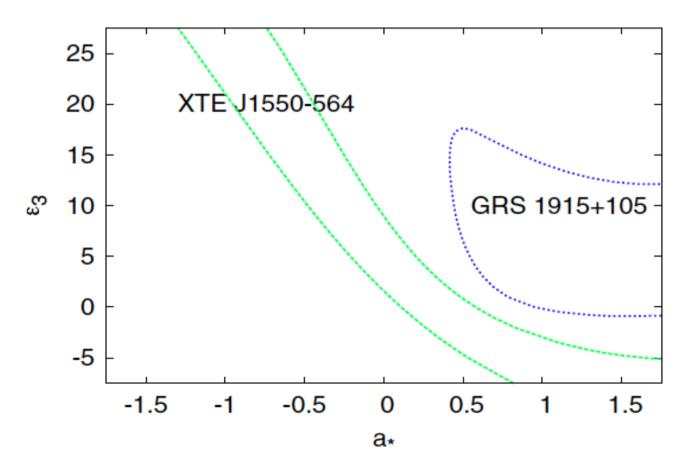

• The continuum-fitting method measures the radiative efficiency: Efficiency = $1 - E_{ISCO}$

Cosimo Bambi (LMU Munich)

Spin parameter – Deformation parameter plane

• The continuum-fitting method measures the radiative efficiency: Efficiency = $1 - E_{ISCO}$

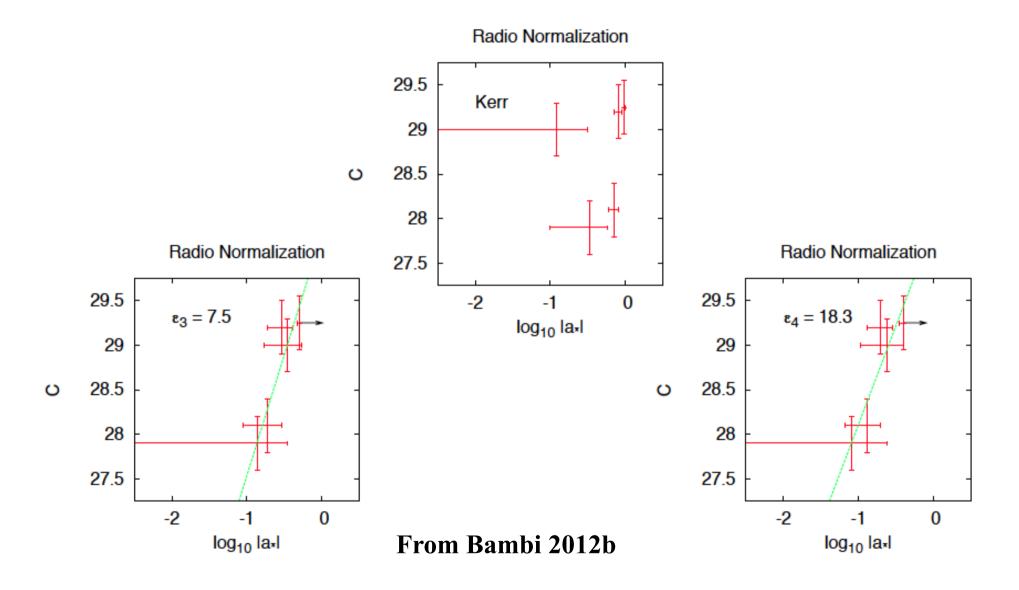

Cosimo Bambi (LMU Munich)

Jet power

- Motivations
- Theoretical and observational facts
- How can we test the Kerr-nature of astrophysical BH candiudates?
- Continuum-fitting method
- Jet power

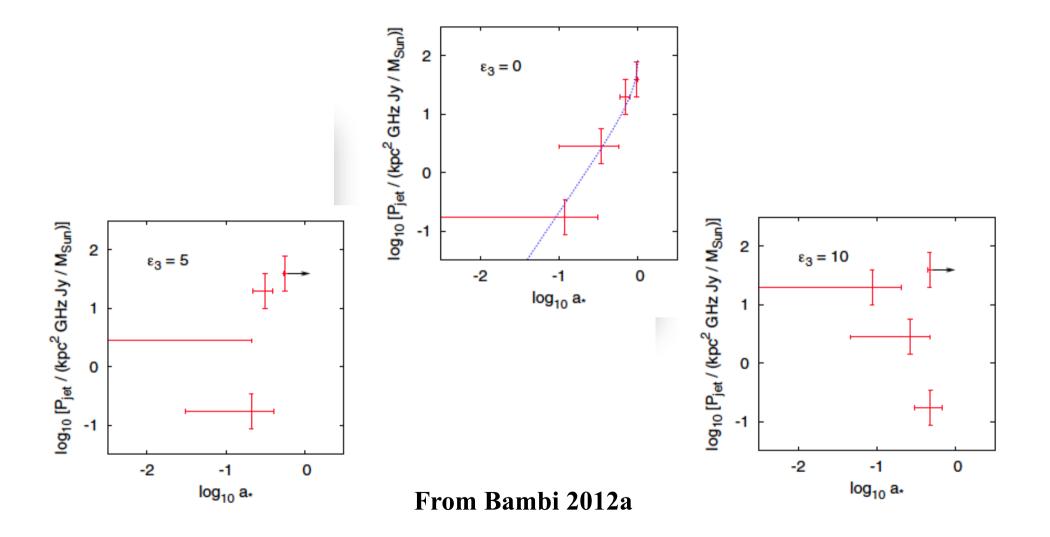

- Jets are commonly produced by accreting BH candidates
- Two kinds of jets in the case of stellar-mass BH candidates: steady jets (in the hard state) and transient jets (usually when the source switches from the hard to the soft state)
- The exact mechanism producing these jets is not known
- For steady jets, a quite appealing scenario is the Blandford-Znajek mechanism, in which the jet is powered by the rotational energy of the BH
- No observational evidence for a correlation between jet power and BH spin (Fender, Gallo & Russell 2010)
- Claim of observational evidence for a correlation between power of transient jets and BH spin (Narayan & McClintock 2012)

Steady jets

Cosimo Bambi (LMU Munich)

Transient jets

Cosimo Bambi (LMU Munich)

Conclusion

- There is a body of observational evidence supporting the existence of dark and compact objects in the Galaxy and in the Universe. These objects are thought to be Kerr black holes
- The Kerr black hole hypothesis can be tested with the already available X-ray data by extending the continuum-fitting method to non-Kerr backgrounds
- One typically finds a degeneracy between the spin and the deformation parameter
- This degeneracy can be broken by adding another measurement (e.g. the power of steady/transient jets)
