

Target of Opportunity and Rapid Response Mode observations at ESO

Target of Opportunity Observations (ToOs) aim at the follow-up of unpredictable transient phenomena that require observations within a few days. Rapid Response Mode observations (RRMs) allow the automatic trigger of observations of transient phenomena that require immediate follow-up within a few minutes. I will present the workflow for ToO and RRM observations at ESO and will highlight our continuous efforts to improve tools and procedures to facilitate multi-mission, multi-wavelength, and multi-messenger observations of transient objects.
