

Discovery of Relativistic Outflows in the Seyfert Galaxies Ark 564 and Mrk 590

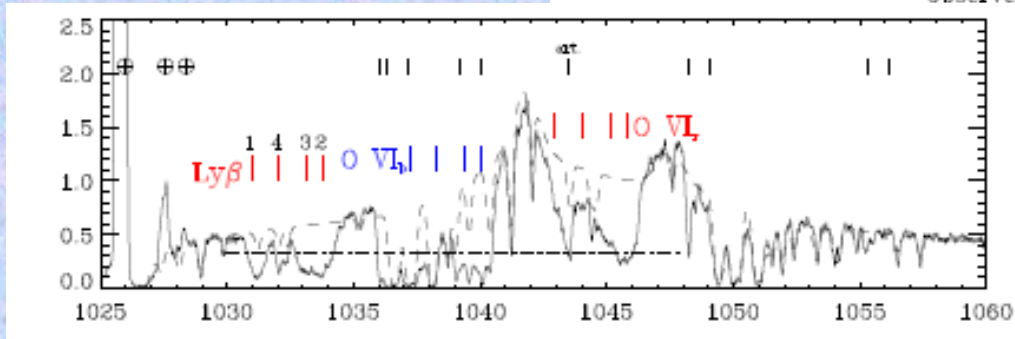

Anjali Gupta

Columbus State

Collaborators: Smita Mathur, Yair Krongold

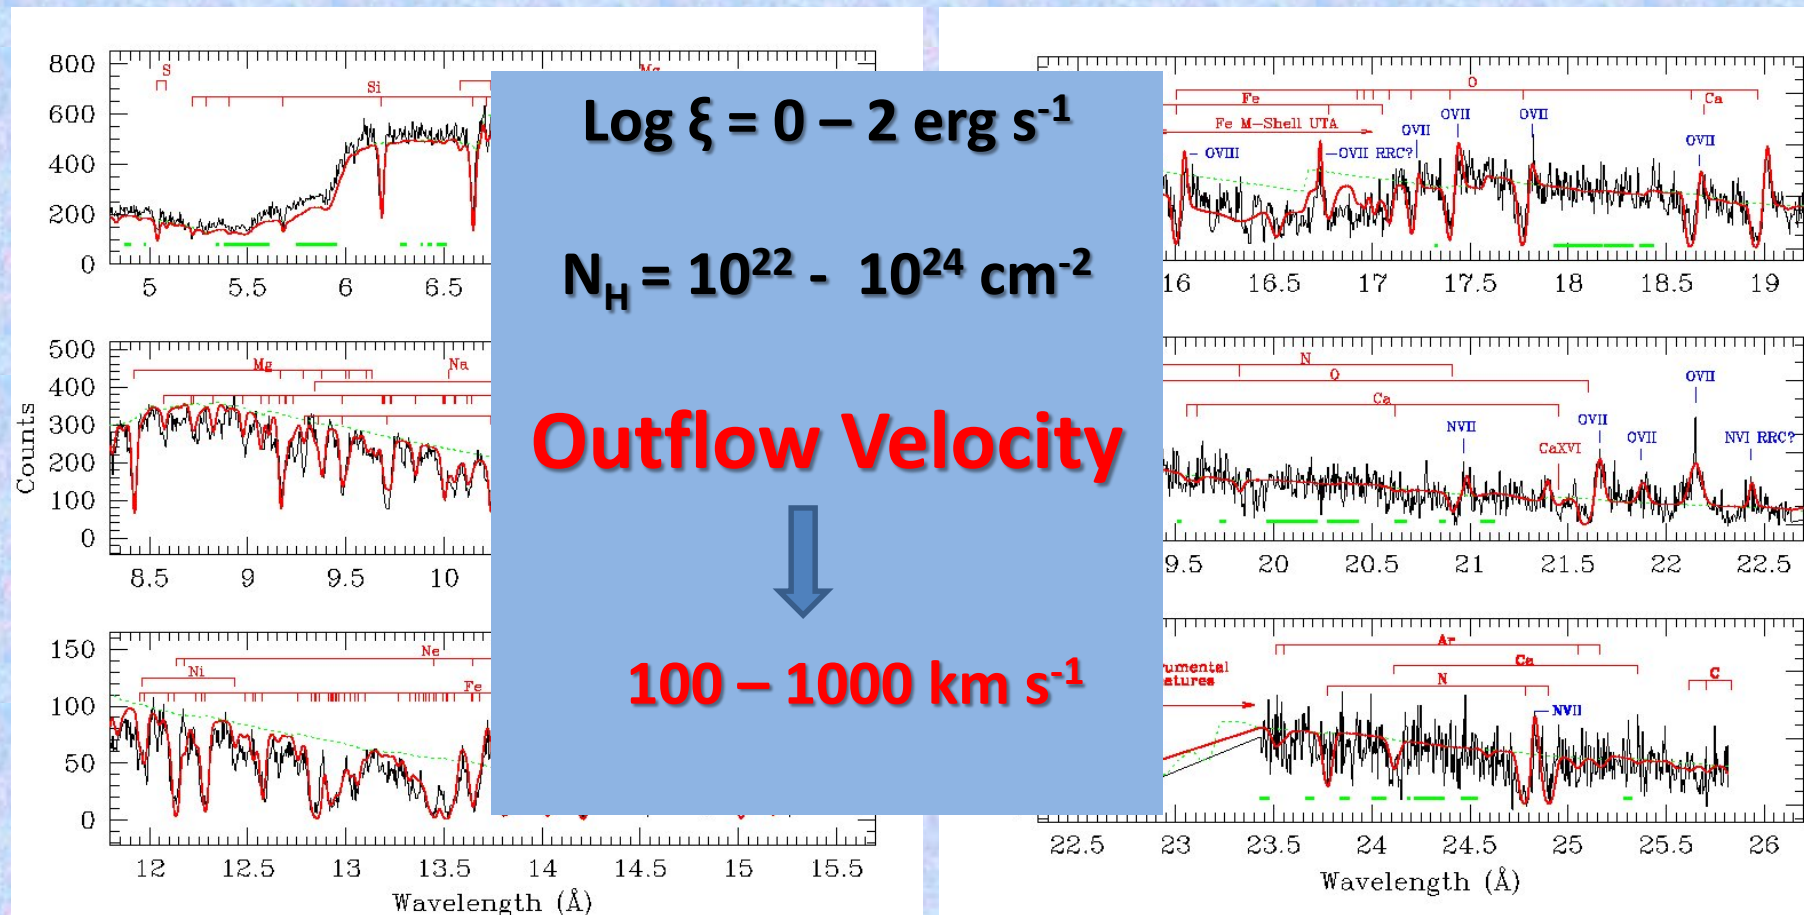

Low velocity outflows are ubiquitous

Seen in 50% of Seyfert galaxies.

NGC 3783 HST and FUSE

Warm Absorbers

Krongold et al. 2003

**Do outflows carry sufficient
energy and momentum to be effective
agents of feedback?**

What is the distance of the absorber from the nucleus?

Proposals span a factor of $> 10^6$
from accretion disk to Kpc scale
narrow line region

$$n R^2$$

Variability

Density → **Distance**

$$t_{eq}^{x^i, x^{i+1}} \sim \left[\frac{1}{\alpha_{rec}(x^i, T_e)_{eq} n_e} \right] \times \left[\frac{1}{[\alpha_{rec}(x^{i-1}, T_e)/\alpha_{rec}(x^i, T_e)]_{eq} + [n_{x^{i+1}}/n_{x^i}]} \right]$$

XMM Observations of NGC 4051

- **RGS → High resolution spectrum**
- **EPIC → Variability**

Krongold et al. 2007

Two-Phase Absorber

- **HIP: a high ionization parameter component:
O VIII; Ne X**
- **LIP: a low ionization parameter component:
Fe UTA, UV lines**
- **In pressure equilibrium**

Krongold et al.2003; Netzer et al. 2003

Energy outflow rates

Kinetic power released: $\sim 10^{38}$ erg/s

c.f. bolometric luminosity: 2.5×10^{43} erg/s

Energy injection rate in the surrounding medium is significantly smaller than that in feedback models

Scannapieco
Silk

Discovery of UFOs

$$\text{Log } \xi = 3 - 6 \text{ erg s}^{-1}$$

$$N_{\text{H}} = 10^{22} - 10^{24} \text{ cm}^{-2}$$

Outflow Velocity

$$0.1c - 0.3c$$

In PG1211+143: Pounds et al. 2003

Kinetic Luminosity

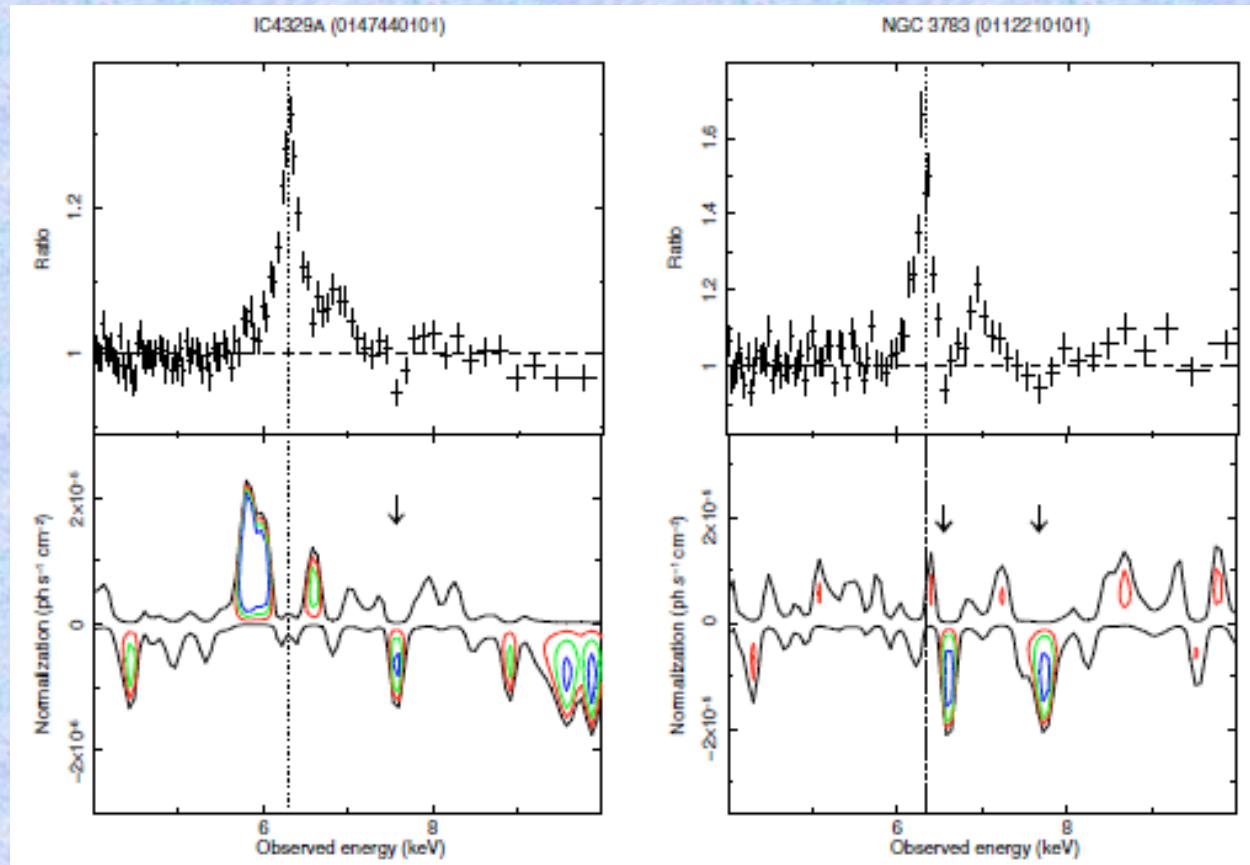

● Warm Absorbers

○ UFOs

From Tombesi et al. 2013

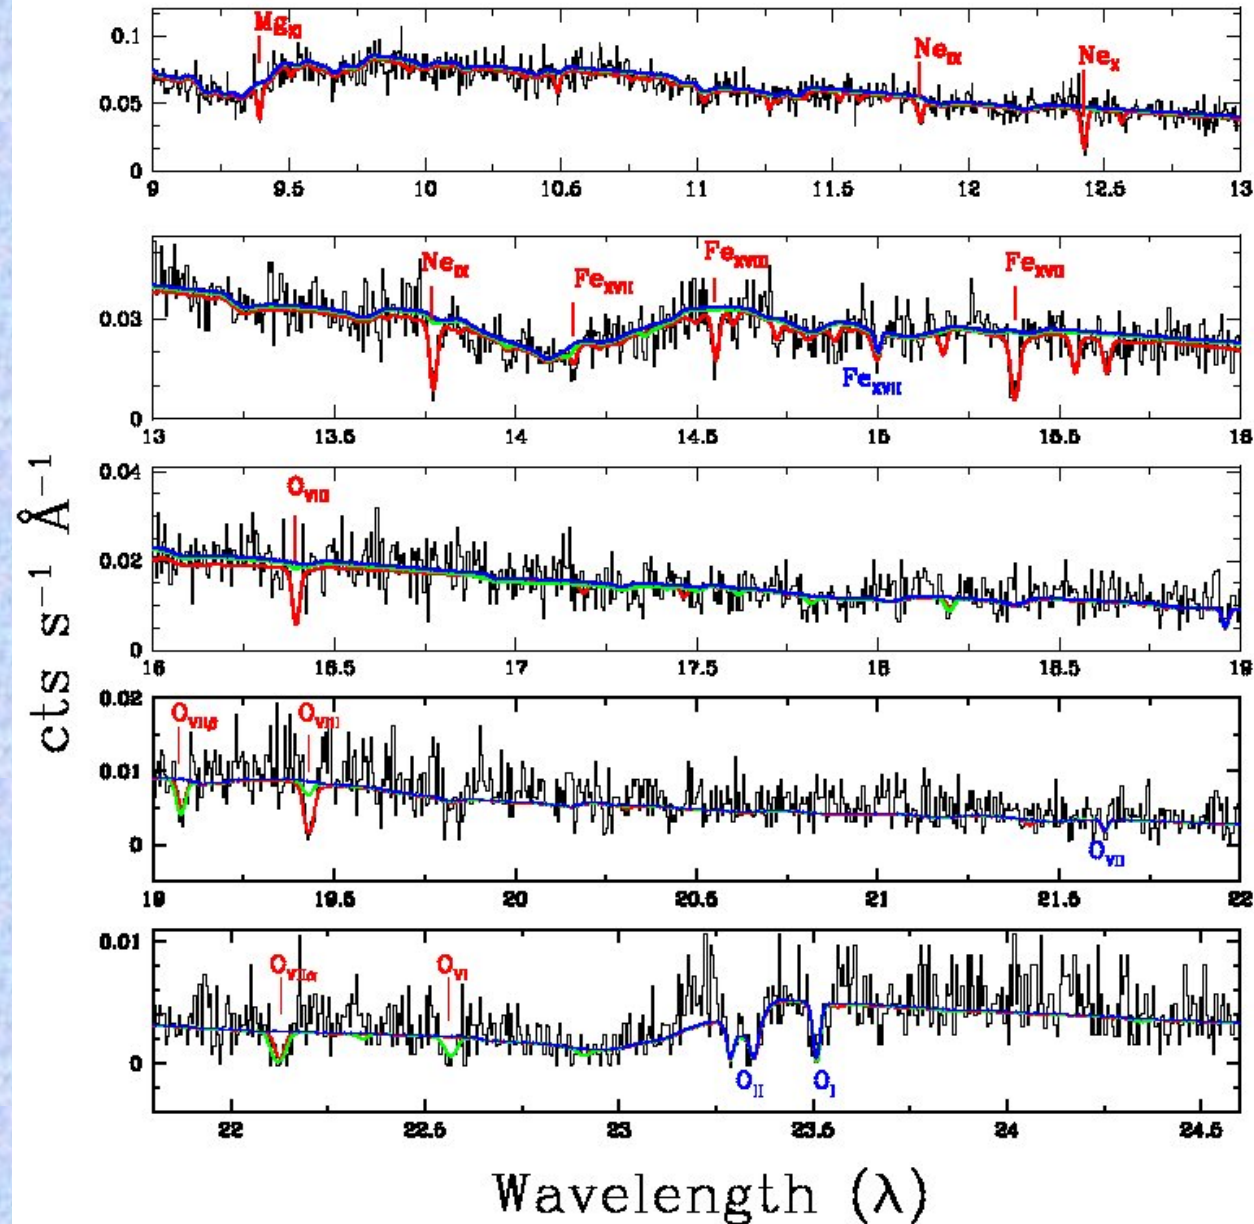

UFOs

----- all in low resolution CCD spectra.

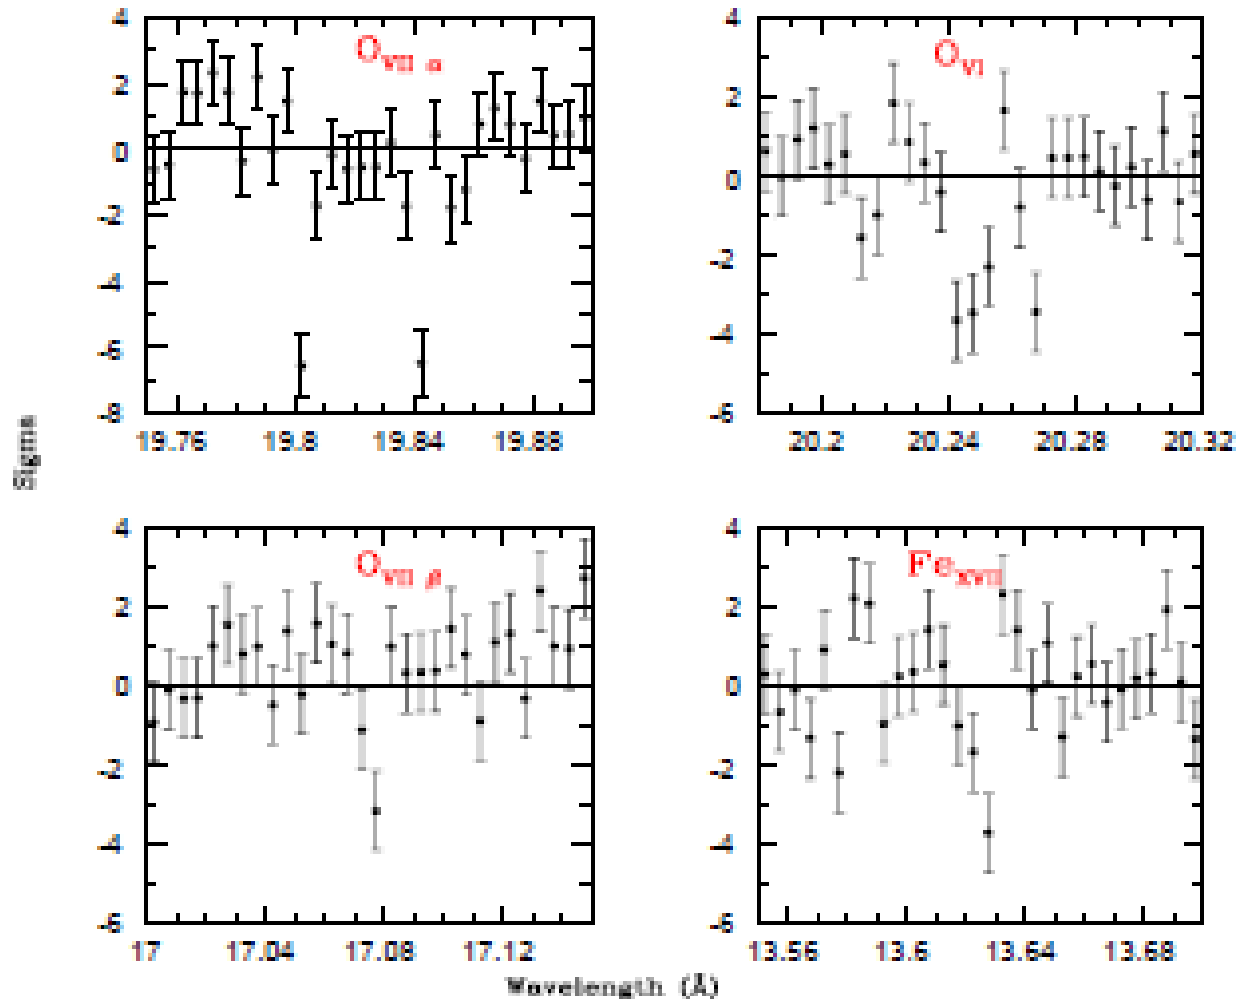

Tombesi et al. 2010

Low-velocity outflow in Ark 564

Discovery of relativistic outflow in Ark 564

Velocity = 0.1c

Sigma

ObsID: 9898

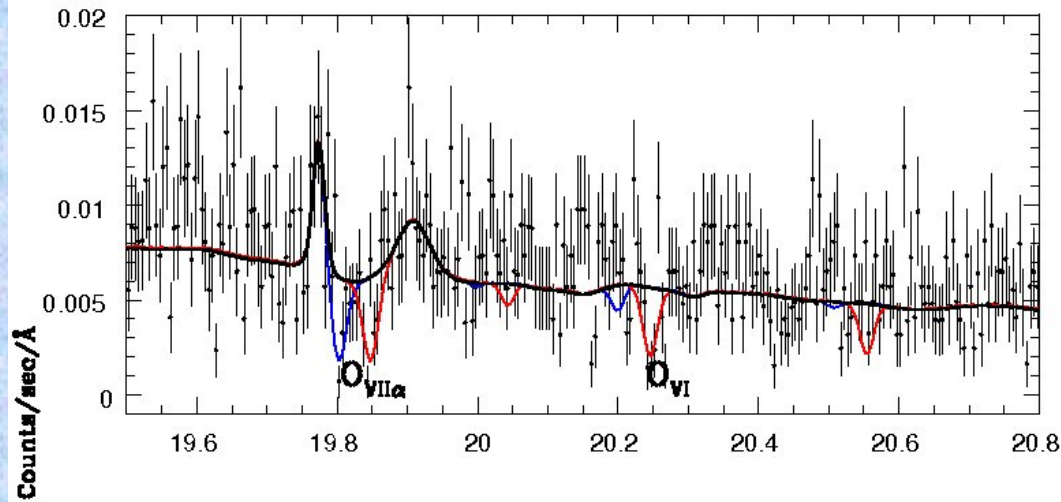

ObsID: 9899

ObsID: 10575

....well fit with photoionization model

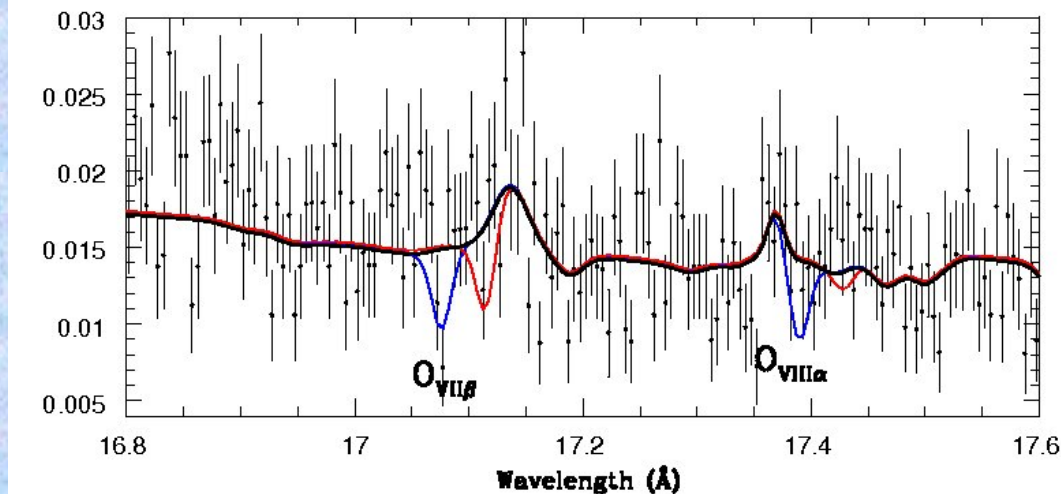

$$\text{Log } \xi = 1.25/0.65 \text{ erg s}^{-1}$$

$$N_{\text{H}} = 10^{19.8}/10^{20} \text{ cm}^{-2}$$

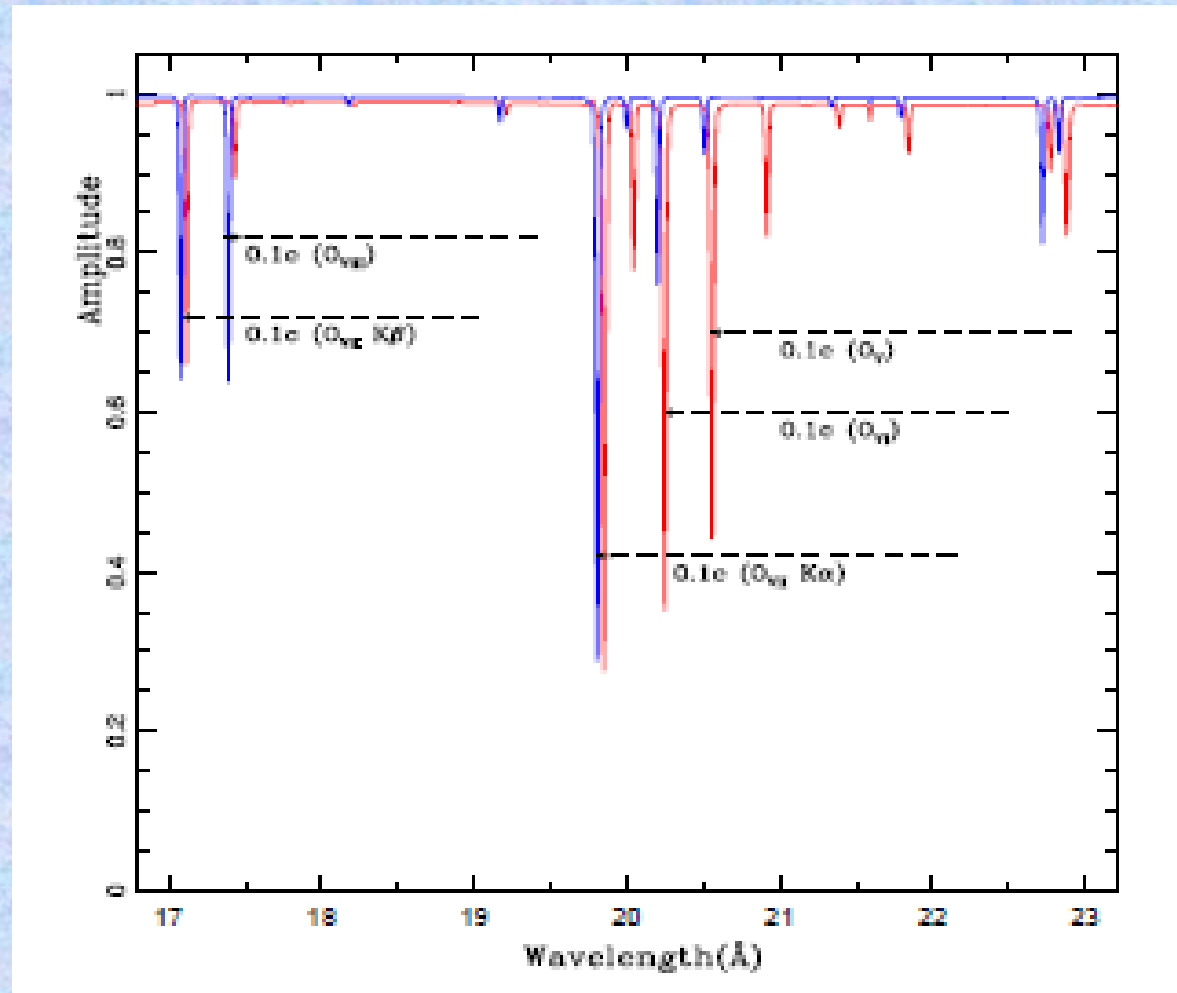

Outflow Velocity

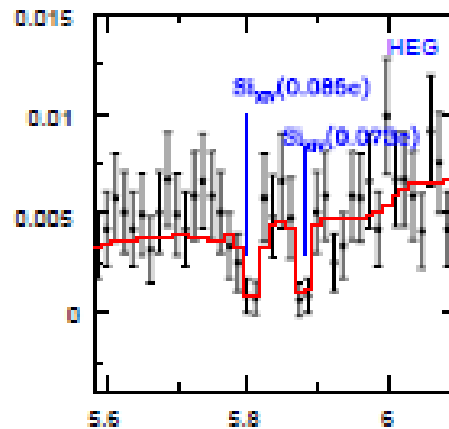

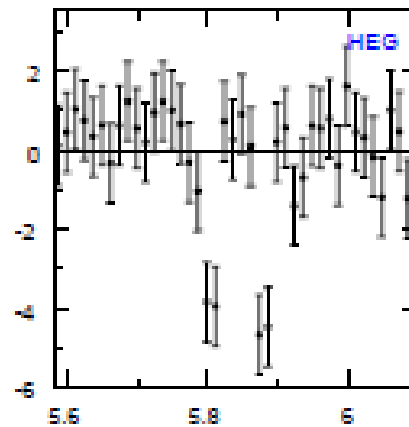

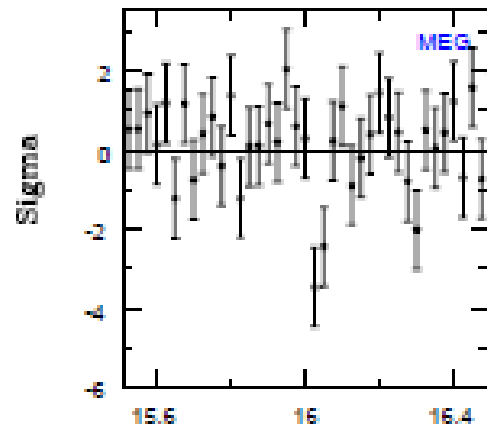

$$0.108c/0.106c$$

Two component photoionization model

Relativistic outflow in Mrk 590?

$$V = 0.081c - 0.176c$$

....and its photoionization model

HV-LIP

$$\text{Log } \xi = 2.24 \text{ erg s}^{-1}$$

$$N_H = 10^{20.94} \text{ cm}^{-2}$$

$$\text{Outflow Velocity} = 0.176c$$

HV-HIP

$$\text{Log } \xi = 4.5 \text{ erg s}^{-1}$$

$$N_H = 10^{23.5} \text{ cm}^{-2}$$

$$\text{Outflow Velocity} = 0.0867c/0.0738c$$

Kinetic Luminosity of Relativistic Outflows

HV-LIP Kinetic luminosity $> 10^{41}$ erg/s

HV-HIP Kinetic luminosity $> 10^{44}$ erg/s

c.f. X-ray luminosity: 7.0×10^{42} erg/s

This IS a remarkable discovery!

- Relativistic outflows known only in luminous quasars
 - BALQSOs in UV
 - Few in hard X-rays: Fe line
- First example in soft X-rays: Robust!
 - better instrumental response
 - multiple lines at the same velocity
- Physical parameters well determined.

.....WA and UFO connection ?

....unlike other AGN outflows

Disk-wind models of AGNs

Proga & Kallan 2004

What is the driving mechanism?

- Radiation pressure doesn't work
- Magneto-hydrodynamics?
- Failed jets?
