Scattered GRXE component

June 16, 2014 1 / 17

Galactic Ridge X-ray emission (GRXE) First observed by *Worral et al. 1982*

• Luminosity:

 $\sim 1.4 \times 10^{38}$ erg/s in 3-20keV (*Revnivtsev et al 2006*) $3.7 \pm 0.2 \times 10^{37}$ erg/s in 17-60keV (*Krivonos et al 2007*)

 Spectrum: strong emission lines in 6-7keV range (if thermal ⇒ kT = 5 − 10 keV)

Revnivtsev et al 2006: RXTE/PCA map of the Galactic plane (3-20keV)

Origin of the GRXE

Thermal emission (\times)

• Milky Way's potential well too shallow to contain such a hot plasma (Koyama et al 1986, Sunyaev et al 1993, Tanaka et al 1999)

Stellar GRXE (\checkmark): Low-luminosity Galactic X-ray sources

- Spectral analysis
- Direct resolution of low-luminosity sources
- Morphology of emission

Evidence of stellar origin of GRXE

Spectral analysis [*Ebisawa et al 2001,2005; Sazonov et al 2006; Revnivtsev et al 2006; Morihana et al 2013; Warwick et al 2014*]

Direct resolution of low-luminosity sources

Chandra deep field (*l* = 0.08°, *b* = -1.42°):
 80 - 90% in 6-7keV *Revnivtsev et al 2009* (50% in *Morihana2012* and *lso et al 2012*)

Chandra X-ray observatory: Revnivtsev et al 2009 GRXE morphology and Galactic stellar population

- Stellar bulge/bar & disk models $(z_d \sim 130 \text{ pc})$ (*Revnivtsev et al 2006*)
- Linear relation with Galactic near-infrared emission (*Revnivtsev et al 2006* in 3-20keV, *Krivonos et al 2007* in 17-60keV)

Revnivtsev et al 2006: RXTE/PCA map of the Galactic plane & near-infrared inferred GRXE (3-20keV)

Origin of the GRXE

Thermal emission (\times)

 Milky Way's potential well too shallow to contain such a hot plasma (Koyama et al 1986, Sunyaev et al 1993, Tanaka et al 1999)

Stellar GRXE (\checkmark): Low-luminosity Galactic X-ray sources

- Spectral analysis
- Direct resolution of low-luminosity sources
- Morphology of emission

Scattered GRXE (?): Scattering of luminous Galactic X-ray binaries by the interstellar medium

Predicted by Sunyaev et al 1993

ISM distribution

Smooth disk model:

$$\begin{split} \rho_{\rm HI} &\propto \frac{1}{2z_d} \exp \left(-\frac{R_m}{R} - \frac{R}{R_d} - \frac{|z|}{z_d} \right) \\ R_m &= 4 \text{kpc}, \ R_d = 6.4 \text{kpc}, \\ z_d &= 80 \text{pc} \ [Binney \& Tremaine 2008] \\ \rho_{\rm H2} &\propto \exp(-R/R_{\rm H2} - |z|/z_d) \\ R_{\rm H2} &= 2.57 \text{ kpc}, \ z_d &= 80 \text{pc} \\ [Misiriotis et al 2006] \end{split}$$

Spiral structure:

4 spiral arms, $p = 12^{\circ}$ (inward) [*Vallee 1995, 2008*] width= 500pc & ×3 overdensity

 $M_{MW} = 9.5 \times 10^9 \ M_{\odot}$ [Kalberla & Kerp 2009] Solar abundances [Asplund et al 2009]

GRXE components on Galactic plane ($b = 0^{\circ}$)

3-10 keV range:

Note: stellar GRXE is near-infrared inferred (COBE/DIRBE data + linear relations in Revnivtsev et al 2006, Krivonos et al 2007)

• • = • • = •

Ratio of scattered GRXE to stellar GRXE on Galactic plane $(b = 0^{\circ})$

3-20keV: Average scattered GRXE contribution on plane 10-30% Incompleteness of catalog \Rightarrow lower bound on contribution

Molecular clouds: prominent narrow spikes in the GRXE Boston University - Five College Radio Astronomy Observatory Galactic Ring Survey (GRS)

Scattered GRXE componen

June 16, 2014 12 / 17

What can we learn about the Galactic XBs population from the scattered GRXE?

Galactic XBs population compared to other galaxies

Relation between XBs luminosity and galactic properties:

Is the Milky Way underluminous in 2-10keV range?

Reasons for discrepancy:

- SFR: $10^6 10^7$ yrs delay [Gilfanov+2004, Shtykovskiy & Gilfanov 2007]
- Temporal fluctuations (brighter X-ray past?) [Gilfanov+2004, Mineo+2014]

M. Molaro, R. Khatri, R. Sunyaev (MPA)

Simulate XBs catalog to test brighter X-ray past case Assume:

- $M_{\star} = 6 \times 10^{10} M_{\odot}$ [*McMillan 2011*]
- SFR ~ 1M_☉/yr [Robitaille & Whitney 2010]

Monte Carlo sampling:

- density pdfs (LMXBs \propto *M*_{*}, HMXBs \propto *ISM*)
- luminosity functions (LMXBs: *Gilfanov* 2004, HMXBs: *Grimm et al* 2003)

Ratio of scattered GRXE to stellar GRXE on Galactic plane ($b = 0^{\circ}$):

3-20keV: over 50%, can even dominate stellar emission

Inconsistency with resolution of sources?

Compare with *Revnivtsev et al 2009* FoV ($l = 0.08^{\circ}$, $b = -1.42^{\circ}$) in 3-10keV (80-90% emission resolved in 6-7keV band)

Brighter X-ray past allowed by observations!

M. Molaro, R. Khatri, R. Sunyaev (MPA)

Scattered GRXE component

June 16, 2014 16 / 17

Conclusions

Scattered GRXE:

- Truly diffuse component of GRXE (lower bound on contribution: 10-30% of total GRXE in 3-20keV on Galactic plane)
- Thin (scale height $z_d \sim 80$ pc vs $z_d \sim 130$ pc of stellar GRXE)

i) Morphology follows ISM distribution

ii) Molecular clouds show up as prominent features in profiles and maps

Comparison between scattered GRXE and stellar GRXE:

- Can help constrain the average X-ray luminosity of the Galaxy over the past 10,000-30,000 years.
- Current GRXE observations consistent with a brighter X-ray past in Milky Way
