ESA SPICE Service

PSIDA 2022
22nd June 2022

SPICE in a nutshell

SPICE is an information system that uses *ancillary data* to provide Solar System geometry information to scientists and engineers for planetary missions in order to plan and analyze scientific observations from space-born instruments. SPICE was originally developed and maintained by the Navigation and Ancillary Information Facility (NAIF) team of the Jet Propulsion Laboratory (NASA).

“Ancillary data” are those that help scientists and engineers determine:

where the **spacecraft** was **located**

how the spacecraft and its instruments were **oriented** (pointed)

what was the **location, size, shape and orientation of the target** being observed

what **events were occurring** on the spacecraft

- SPICE provides users a large suite of SW used to read SPICE ancillary data files to compute observation geometry.
- The ancillary data (kernels) comes from: The S/C, MOC/SGS, S/C manufacturer and Instrument teams, Science Organizations.

SPICE in a nutshell

Compute many kinds of observation geometry parameters at selected times

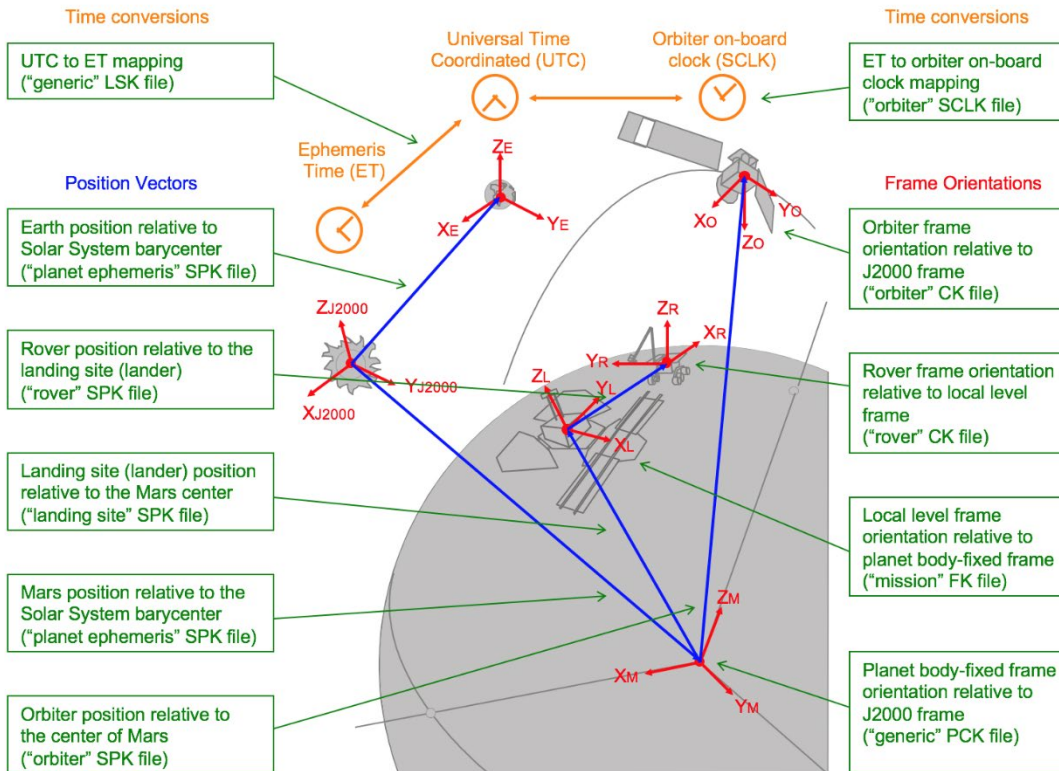

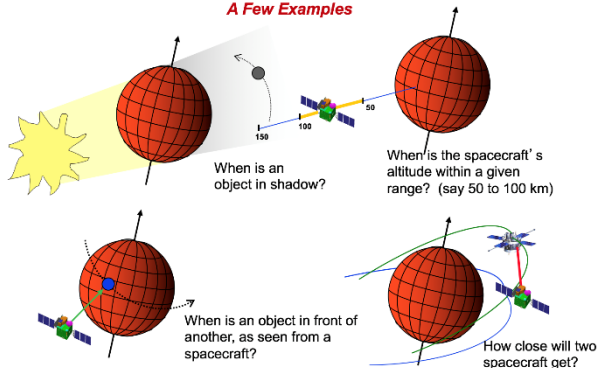

A Few Examples

- Positions and velocities of planets, satellites, comets, asteroids and spacecraft
- Size, shape and orientation of planets, satellites, comets and asteroids
- Orientation of a spacecraft and its various moving structures
- Instrument field-of-view location on a planet's surface or atmosphere

Find times when a specified "geometric event" occurs, or when a specified "geometric condition" exists

A Few Examples

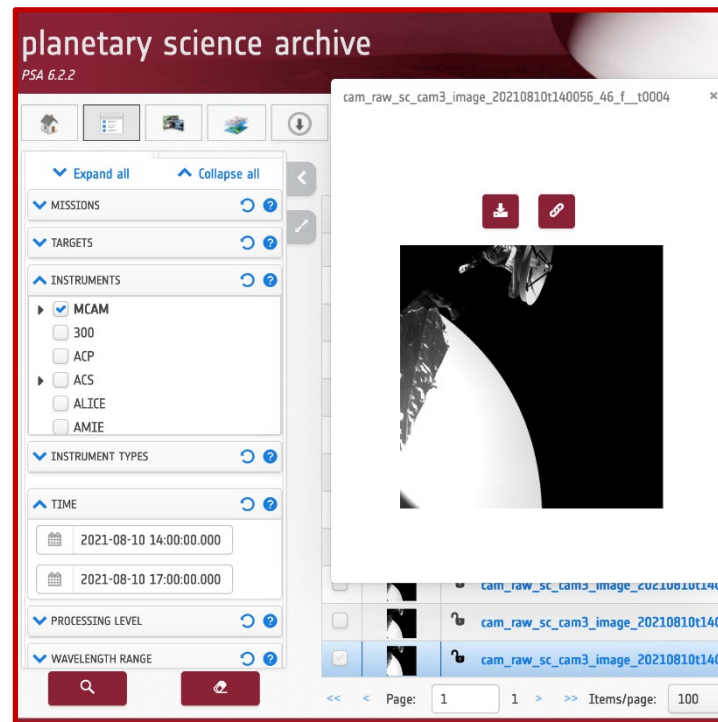

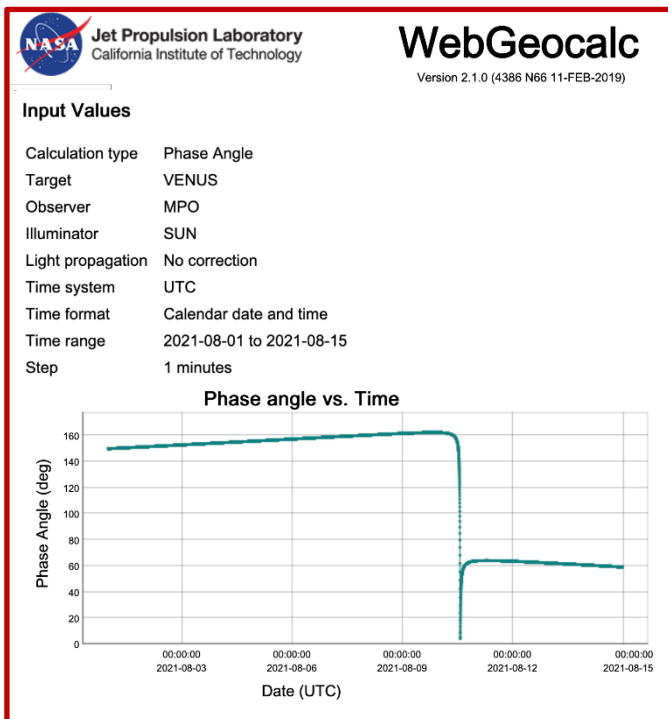

SPICE New Toolkit version N0067

- Released January 3rd, 2022
 - Previous N0066 Toolkit released in April 2017
- Available in 5 programming languages:
 - FORTRAN, C, IDL, MATLAB, and alpha-test Java Native Interface (JNI)
 - SpiceyPy 5.0.0 (Python) switched to N67 CSPICE, no new wrapper functions yet
- **New N0067 Toolkits are 100% backward compatible**
- New high-level routines in all languages
 - Tangent point (TANGPT), Target separation (TRGSEP)
- New reference frame types
 - Switch frames choose at run time other frames with which to align their orientation.
 - Product frames defined by a product of one or more frame transformations.

Using SPICE

- We want to analyze **BepiColombo Venus fly-by images** from the **MCAM** instrument, more concretely images with Phase angle (angle between illumination source and viewing location) smaller than 90 deg ➡ **WebGeocalc or GF System**
- Then we could constrain our search in the PSA UI.

Using SPICE – Synthetic Image Generation

➤ BepiColombo Venus fly-by #2

```
load last meta-kernel  
load dsk  
loop per pixel  
spice.getfov  
spice.sincpt  
spice.illumf  
adjust matrix
```

75 lines of code

Using SPICE – Tiled DSKs

- Generated **high-resolution tiled global DSK** for **Mercury** based on Messenger 665m/px global DEM and for **Mars** based on MOLA 463m/px global DEM
- Available at the esa_generic SKD in spiftp (not included in BitBucket due to large size)
 - https://spiftp.esac.esa.int/data/SPICE/esa_generic/kernels/dsk/tiled/

Philae Final Position Reconstruction

➤ DSKs can be loaded into Cosmographia from version 4.1

The **ESA SPICE Service (ESS)** based at ESAC leads the SPICE operations for ESA's planetary missions. Its main activities are:

- Generate, develop, maintain and archive the SPICE Kernel Datasets (SKD) for the ESA Planetary Missions (and Solar Orbiter);
- Develop and operates software to convert orbit, attitude, telemetry and spacecraft clock correlation data into the corresponding SPICE formats;
- Provide consultancy and support to the Science Ground Segments and the Science Community of the planetary missions for SPICE and ancillary data management.

**Available, SPICE
Kernels Datasets:**
Releases and support
to the community is
provided

ESA SPICE Service are: Alfredo Escalante, Ricardo Vallés and (sometimes) a trainee, the group is managed by Christophe Arviset.

ESS also provides an instance of **WebGeocalc** and the **Cosmographia** configuration for ESA missions:

- **WebGeocalc** is a web-based interface to some SPICE Functions, extremely powerful for quick-look data analysis
- **Cosmographia** is a 3D-Visualization Tool for a full SPICE Scenario.

We provide **SPICE Training Classes** in Europe in a biannual basis. Last training June 2020 was cancelled due to the pandemic.

Recording of last SPICE Training at ESAC is available in YouTube

ESA SPICE Service - Updates

- We have introduced HTTPS browsing to our spiftp server:

Version and Configuration Control

- All SKDs are under configuration control and new release happen constantly.
- SKDs are released on a regular basis when STKs are updated and when in operations are time tagged in a daily/weekly basis when TVKs are updated.

The distribution of SKDs is done via:

An operational FTP with all the kernels that were ever produced:

<ftp://spiftp.esac.esa.int/data/SPICE>

<https://spiftp.esac.esa.int/data/>

A permanent link to a ZIP file that contains the latest operational subset of the SPICE Kernels

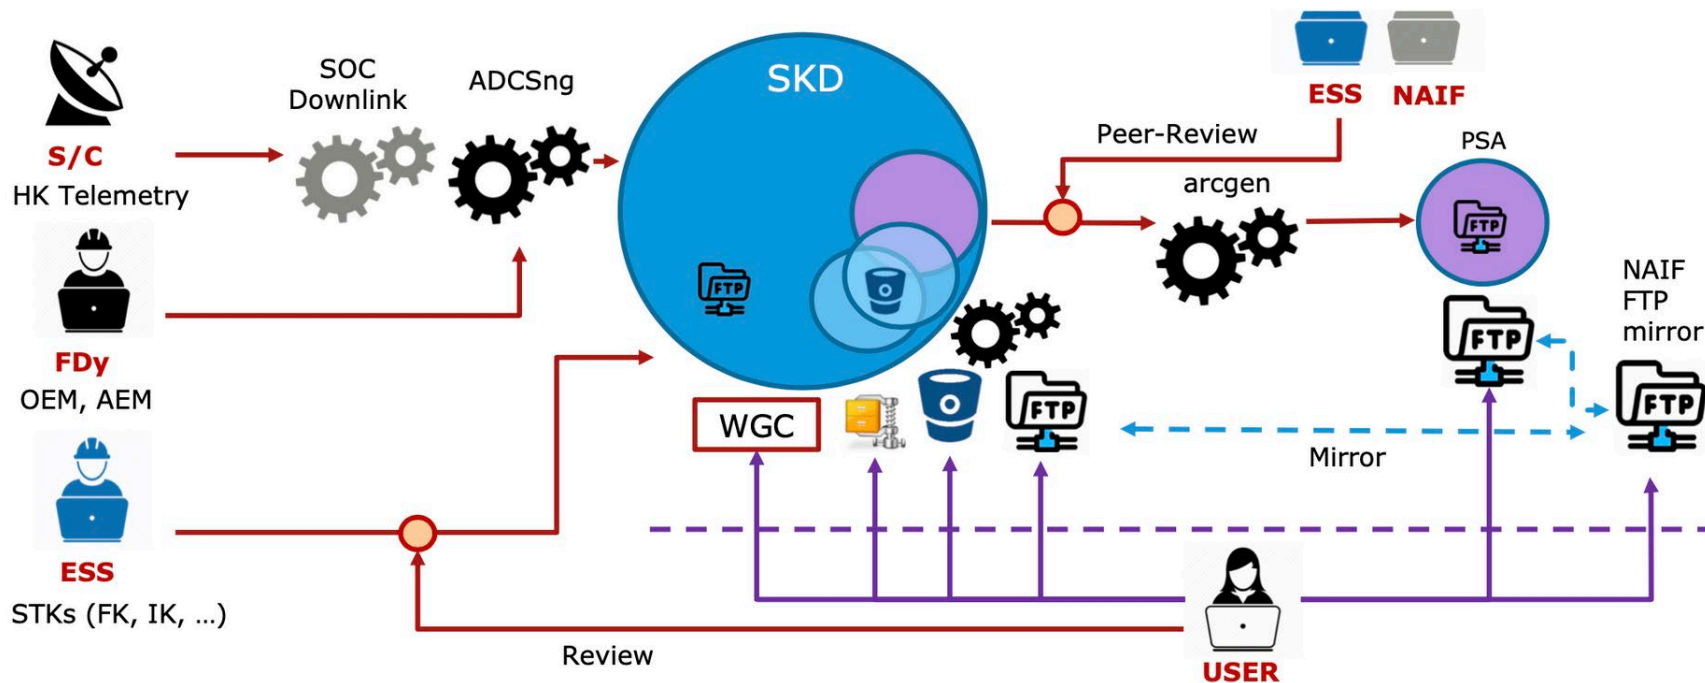

A BitBucket Git repository with a given subset of the SPICE Kernels (operational, planning, archived etc.). https://repos.cosmos.esa.int/socci/projects/SPICE_KERNELS

Cosmo configuration is available in the misc directory of the SPICE Kernels Dataset
Sensor model is available for each instrument (if not, let us know)

SPICE Kernel Dataset Workflow

- The Auxiliary Data Conversion System next-generation (ADCSng) generates the time-varying kernels when the mission is in operations and provides up-to-date time correlation, trajectory and orientation information to users.

ESA SKD Status

Solar System Exploration

Planetary Defense

Heliophysics

Space Observatories

Mission	Status	BitBucket	Archive	WGC	Cosmo	Frames and sensors	Predicted Orbit & Attitude	Reconstructed Orbit & Attitude	OBT conversion	S/C Element and Payload Orientation

PDS3 SPICE datasets and PDS4 SPICE bundles for the archive produced by the ESS are/will be available from the PSA UI, the PSA FTP server and the NAIF FTP server. Increments of the archives are published every 4-6 months.

PDS3 Archives

➤ Current PDS3 Archived SPICE datasets available:

- Mars Express **Last updated 2022-06-01**
- Rosetta **Last updated 2022-01-19**
- Venus Express **Last updated 2020-12-29**

Next increment ~ Summer 2022

Next increment ~ Summer 2022

PDS4 Archives

➤ First PDS4 SPICE Bundle is **ExoMars2016 last updated 2022-02-15**.

➤ First **BepiColombo PDS4 Bundle release follows in Summer 2022**.

➤ The PDS4 approach with SPICE is to minimize the effort required to archive SPICE kernels; the idea is to apply minimal changes to an operational SPICE Kernel Dataset.

➤ Bundle structure agreed with NAIF, used by JAXA as well and adopted by the IPDA.

➤ More details available at the PSA PDS4 Archiving Guide, available under request.

Citing the SPICE data

- We have incorporated DOIs for the SPICE Kernels Datasets (Operational and Archived).
- Please use them to cite your work.

ESA SPICE Service, BepiColombo
Operational SPICE Kernel Dataset,
<https://doi.org/10.5270/esa-dwuc9bs>

- DOI is indicated in the SPICE collection label of the PDS4 Bundle.
- We will also implement version control of the DOIs but a new DOI will not be issued per version
- And please do the same with the other ESA SPICE Kernel Datasets that you use.
- In addition please keep citing the 'SPICE' paper
- DOI: [10.1016/0032-0633\(95\)00107-7](https://doi.org/10.1016/0032-0633(95)00107-7)

SPICE in ESA Datalabs

- ESA Datalabs allows bringing the code directly to ESA's infrastructure – there is a great set of tools and programming languages are flexible – and execute it with direct access to ESA's archives.

- <https://datalabs.esa.int/>

- ESA datalabs offers a catalog of datalabs you can use. They range from new tools that are quickly become de facto standards to older software that has been repackaged to run inside virtual computers. All are accessible via your web browser.
- Once a Datalab has been launched, Data Volumes can be mounted.
- **The SPICE Data Volume (all content available at spiftp) is already available in Datalabs**

What is next for ESS ?

- Final review and implementation of several SPICE Kernel Datasets: ExoMars2016, BepiColombo, JUICE, Hera, EnVision
- Consolidation of the SPICE Validation Pipeline
- Consolidation of ESS Python packages for the public
 - SPIREC (render images), SPINST (SPICE Setup wizard)
- Implementation of DSKs for extended bodies in all SKDs including:
 - Targets (Small Bodies, planet DEMs, etc)
 - Spacecrafts (Bus, rotating Solar Arrays, HGAs, etc)
- Exploit and share SPICE usage through ESA Datalabs
 - Tutorials, tools, etc

```
max-vmc.ipynb
SPICE for Mars Express VMC Tutorial

This Notebook aims for showing some of the SPICE applications to compute geometry for a planetary mission. In this tutorial, we will focus on the geometry of VMC (Visual Monitoring Camera) onboard Mars Express.

Loading the SPICE Data Volume

In order to load the SPICE Data Volume into this ESA Datalab, the SPICE Volume has to be configured first. To do so, go to Data Volumes at the ESA Datalabs toolbar and introduce the following configuration:

• Name: SPICE
• Path in datalab: /media/data/spice
• Connection type: nfs
• Server: netapp3.evsp.lan
• Path: /mex_spitp01

Once, the SPICE Volume has been configured, go back to the Datalab and select the SPICE Volume in the toolbar at the top right.

Loading the SPICE Kernel Dataset

We will begin by loading some Python packages. We'll use NumPy to create some random data, and Matplotlib to visualize it. SpicePy is the Python wrapper to the NAF's SPICE Toolkit.

[1]: import spicepy as cspice
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.dates as mdates
from PIL import Image
import datetime
import os

Then, the SPICE kernels can be loaded into the pool by using furlsh.

Please note that we should change the working directory to the meta-kernel directory within the SKD (SPICE Kernel Dataset) because the PATH_VALUES within MEX_OPS.TM is set to the relative path from that file to the kernels directory. If the PATH_VALUES field is updated to the absolute path to the kernels directory, it could be loaded from any working directory.

[2]: # Go to the meta-kernel directory of the Mars-Express SKD in the loaded data volume
os.chdir('/media/data/spice/data/SPICE/MARS-EXPRESS/kernels/ak')

# Load the meta-kernel into the kernel pool
cspice.furlsh('MEX_OPS.TM')

Computing Mars Express Position

Once the meta-kernel has been loaded, we can start computing geometric quantities. Let's begin with the Mars Express position with respect to Mars in the Mars centered body-fixed frame.

[3]: # define start and end times
et0 = cspice.ut2et('2021-12-01')
etf = cspice.ut2et('2021-12-02')
times = range(int(et0), int(etf), 10)

# compute Mars Express position wrt Mars
pos_car = cspice.spkpos('MEX', times, 'IAU_MARS', 'NONE', 'MARS')[0]
print(pos_car[-5:])
```
