

# X-ray Analysis of Gigahertz Peaked Galaxies

Olof Tengstrand

Tutor: M. Guainazzi  
European Space Agency  
European Space Astronomy Center  
Madrid/Spain

- **What is a GPS?**
- **My project**
- **Procedure of data reduction.**
  - Spectral modeling
  - Deriving parameters from weak sources
  - Timing analysis
- **Results this far**

- **Radio defined**
  - Gigahertz Peaked Spectrum (GPS)
  - Turnover frequency between 0.4 and 6 GHz
  - Radio spectral index above the peak steeper than -0.5
- **Active galaxies**
  - AGN
  - Strong and small jets (radio)
- **Initial phase of giant jets**

- **Purpose**

- Analyze 9 observations from different GPS to investigate some of the physical properties in the X-ray band.
- Finish the analyzes for a complete sample of 16 GPS.
- Completion of a work published by Guainazzi et al. (2006) & Snellen et al. (2006)
- **Final goal:** Scientific paper describing the x-rays properties of the whole sample.

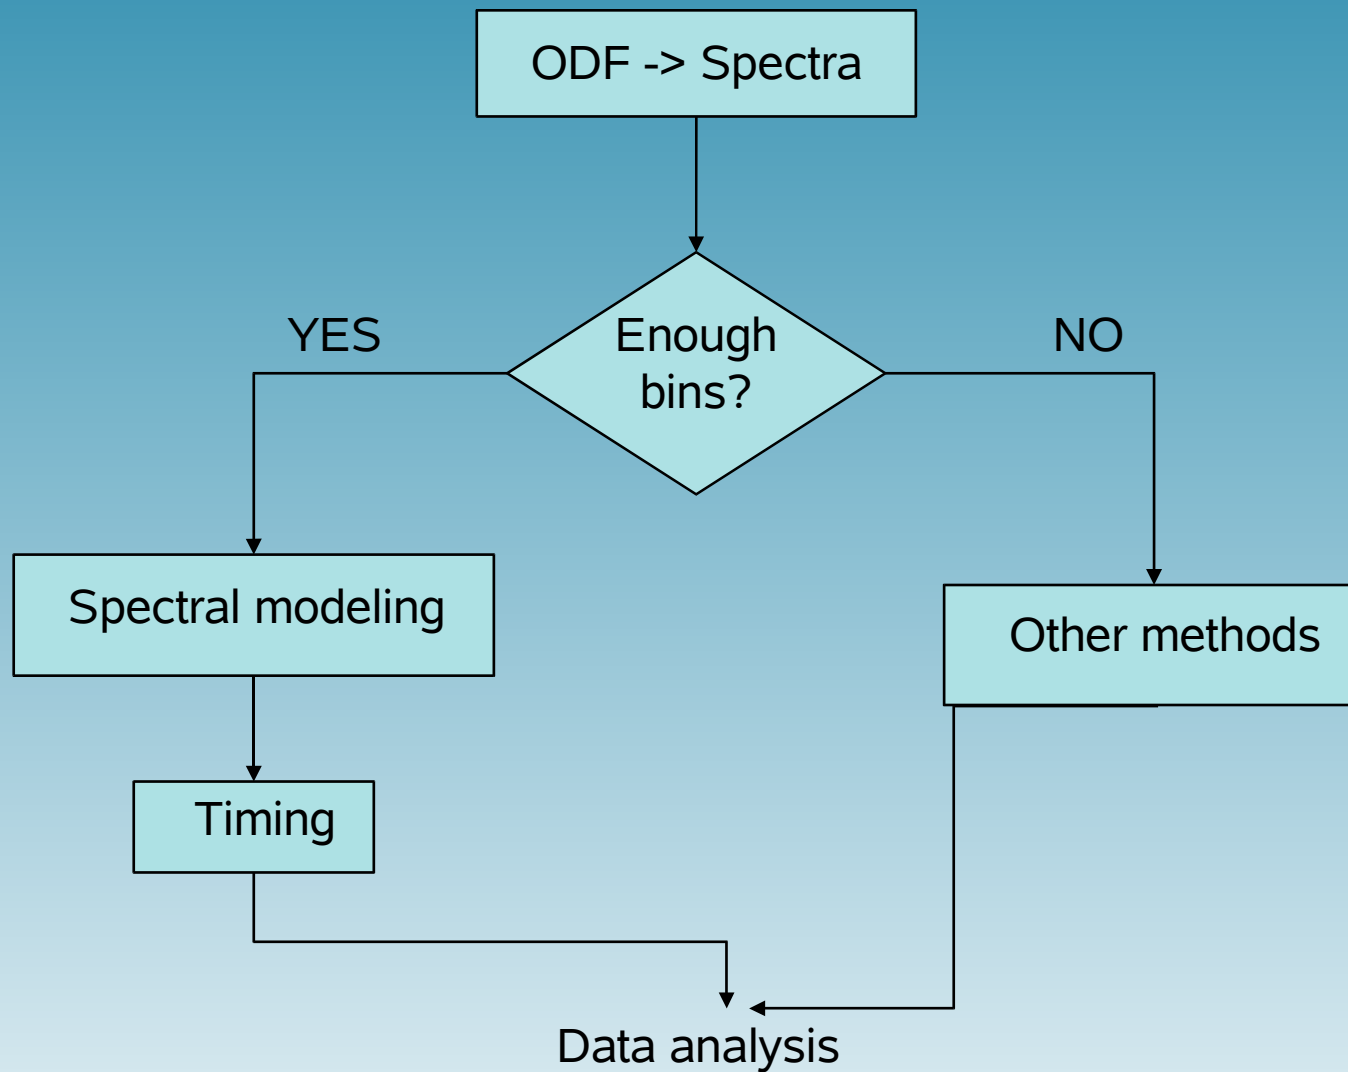

- **The sample**

- 16 GPS galaxies.
- Redshift  $z < 1$ .
- Flux density at 5 GHz above 1 Jy
- Turnover frequency between 0.4 and 6 GHz
- Radio spectral index above the peak steeper than -0.5

- **Limitations and possible problems**

- Used energy range 0.2-10.0 keV
- Weak sources in x-ray

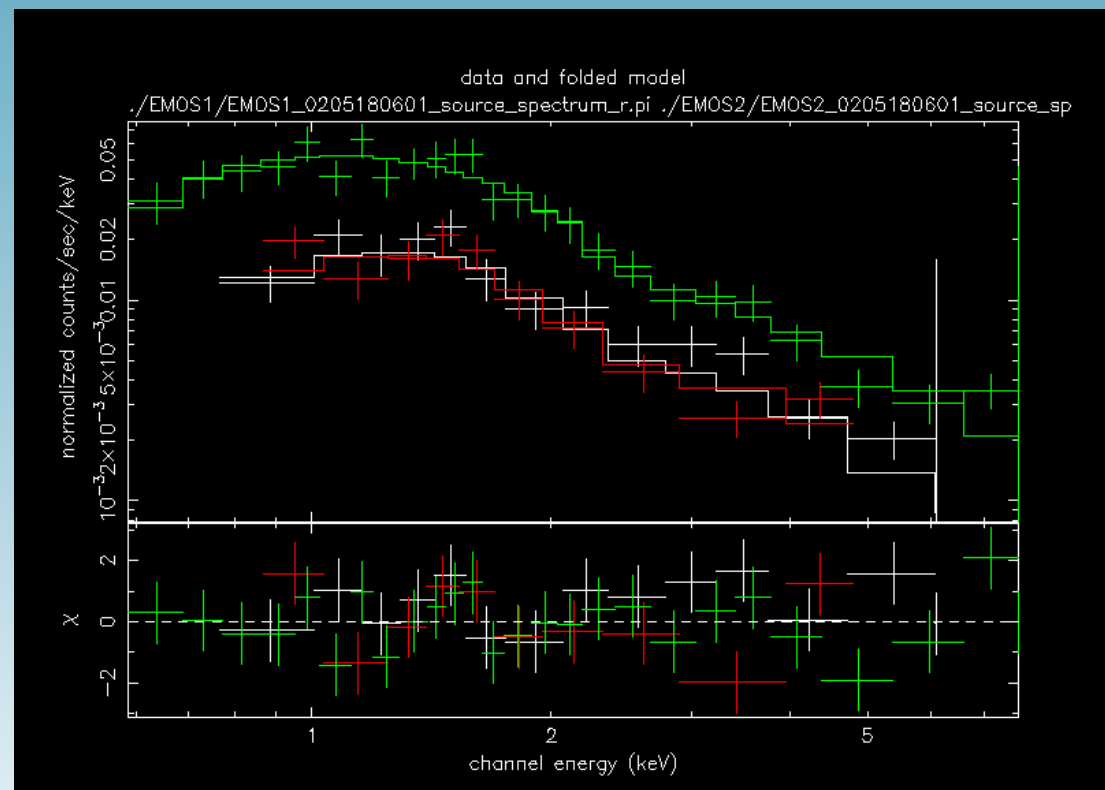

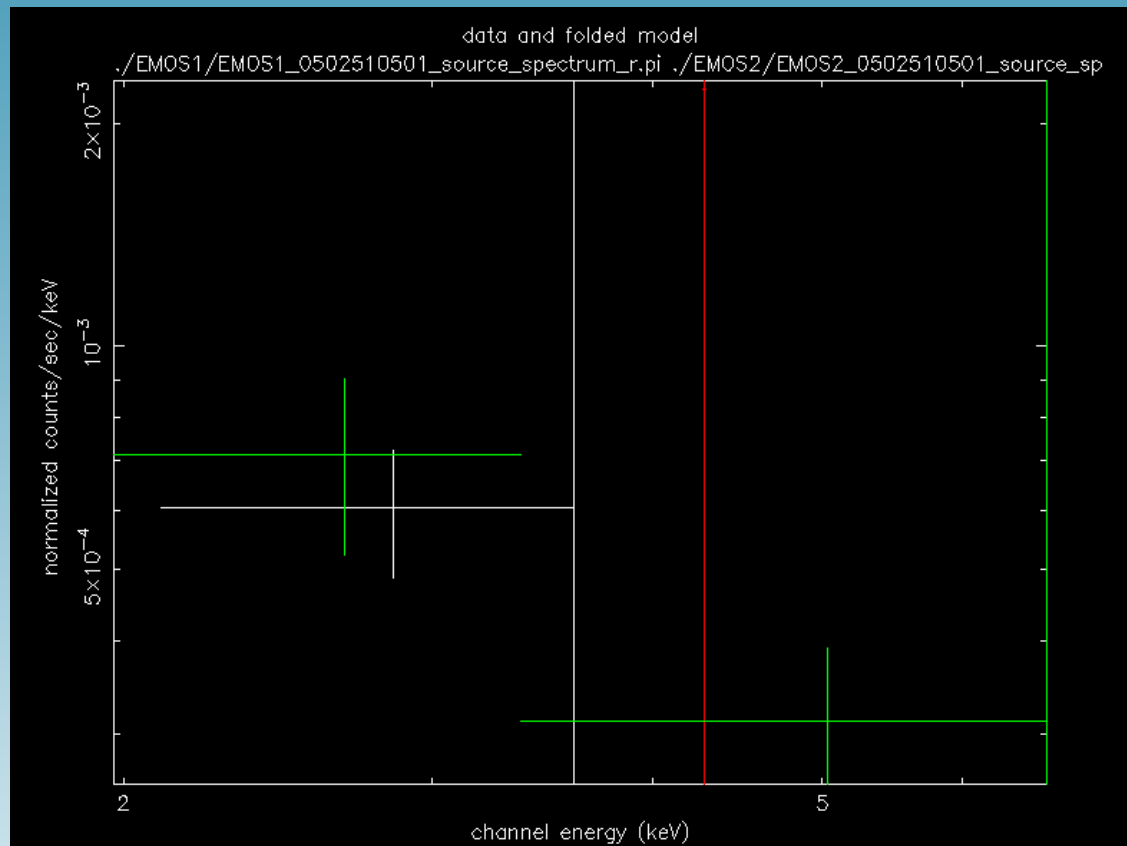

## •Wanted parameters

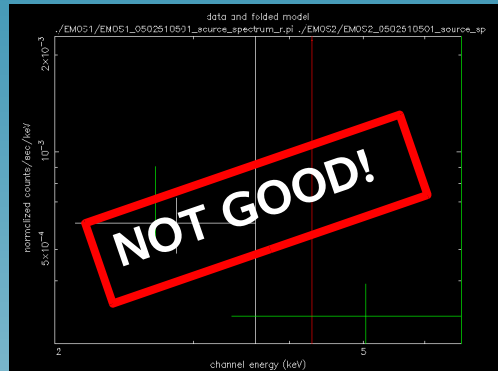

- Column density,  $n_H$
- Photon index,  $\Gamma$
- Flux and Luminosity

## •Model components

- Photon powerlaw
- Photo-electric absorption in our Galaxy
- Photo-electric absorption in the GPS
- Gaussian line profile

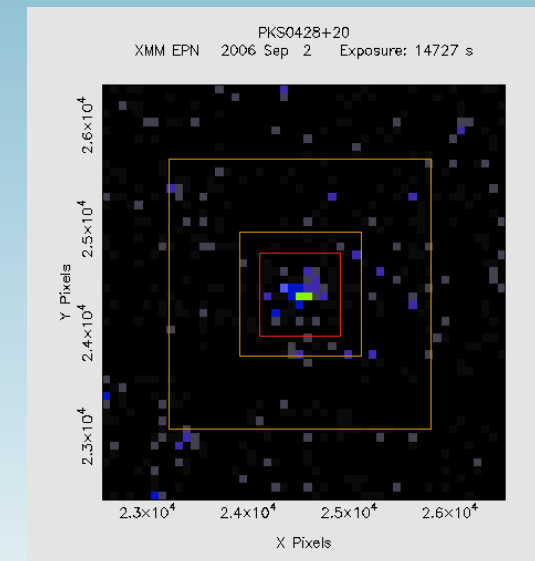

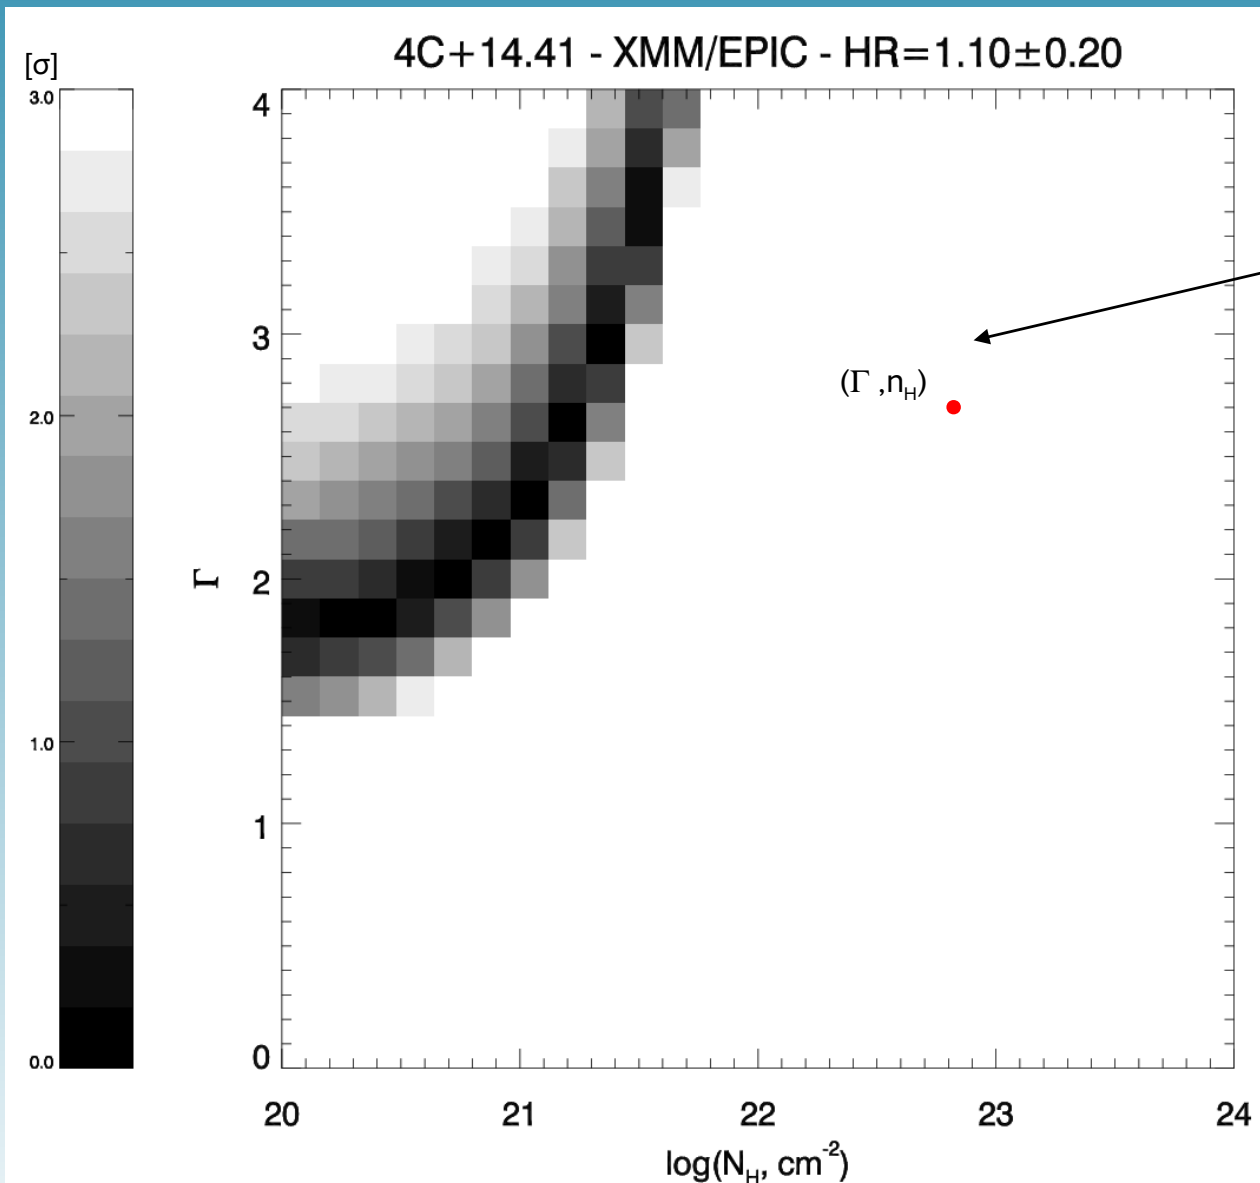

- **Source finding**
  - Use *edetectchain*
  - Counts and errors from *fv*

- **ximage**
  - Counts / upper limits

- Chose a point  $(\Gamma, n_H)$

- Make a spectral model,  $S(E)$  using the chosen parameters

- Calculate:

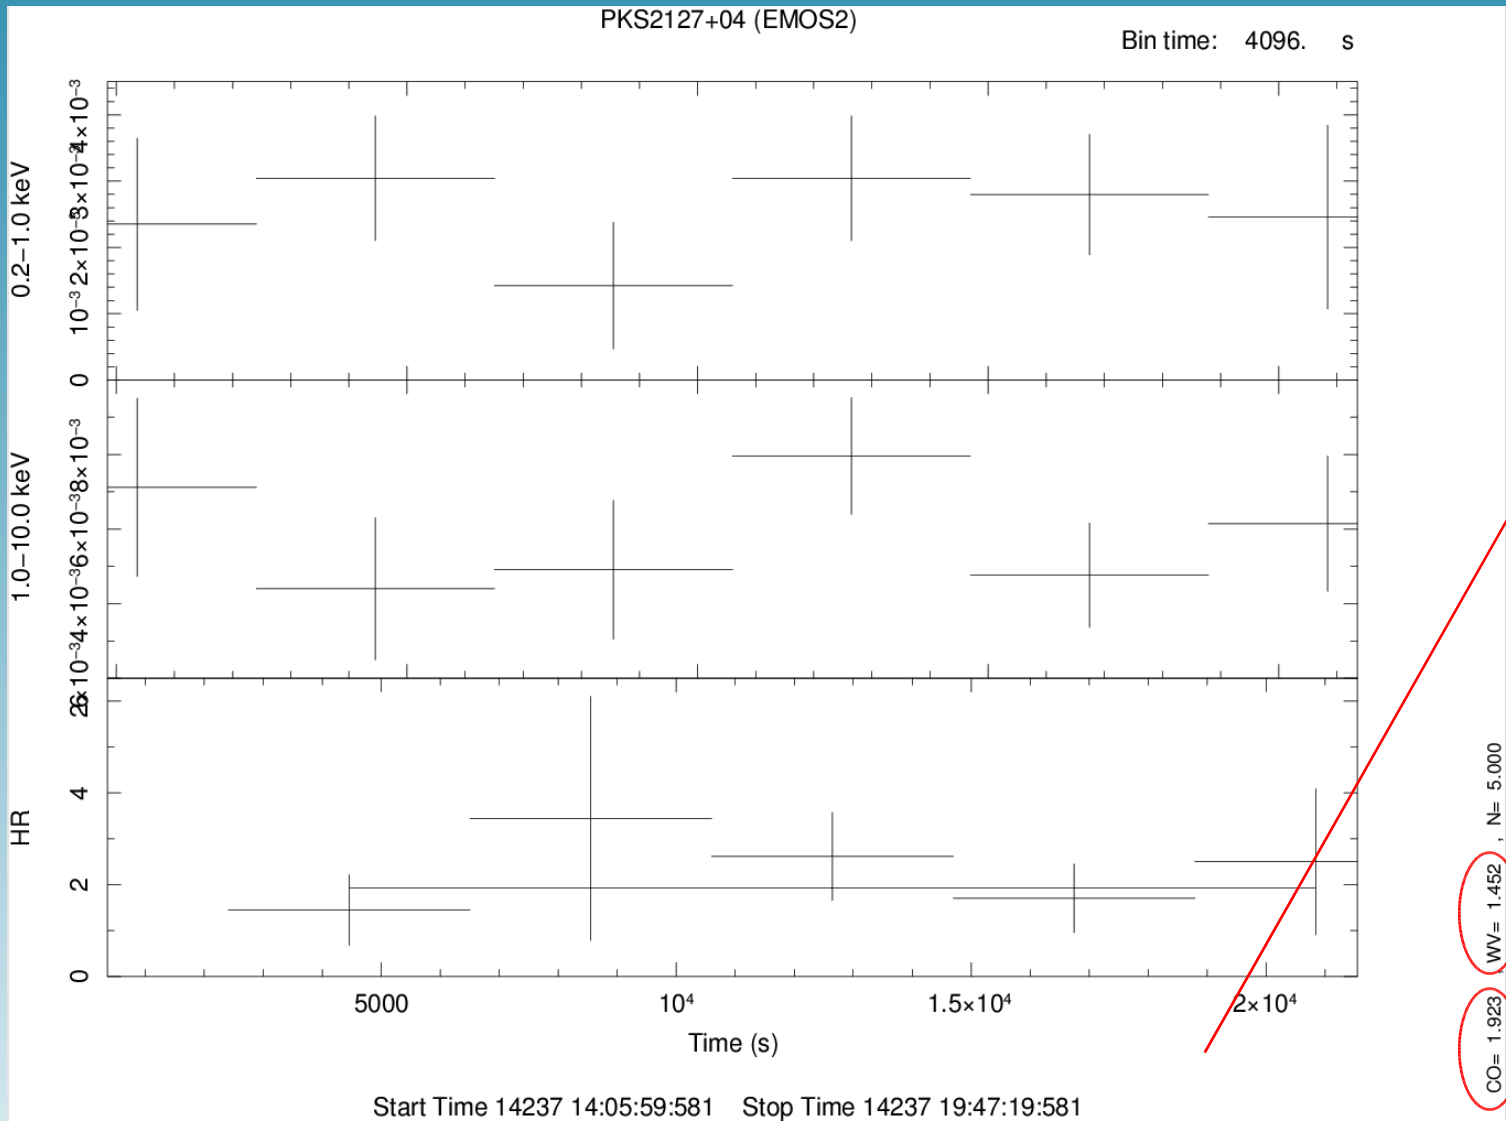

$$HARD_{counts} = \int_{1.0}^{10.0} S(E) * dE$$

$$SOFT_{counts} = \int_{0.2}^{1.0} S(E) * dE$$

$$HR = \frac{HARD_{counts}}{SOFT_{counts}}$$

- Compare with obtained HR

- **6 sources analyzed**
  - 3 lower limits
  - 1 limit
  - 2 spectra
  
- **Spectral modeling**
  - No  $\text{Fe}_{K\alpha}$  emission line detected
  
- **Timing analysis**
  - No time variations detected in the hardness ratio.
