

On a full confirmation and characterization of Kepler planet candidates

Jorge Lillo-Box
and
D. Barrado and H. Bouy

Phases of our follow-up

PHASE	Objective	Instrument	Technique
I	<ul style="list-style-type: none">- To detect isolated host- To detect multiple systems (2 or more stars)	AstraLux (Lucky Imaging)	High-spatial Resolution imaging
II	<ul style="list-style-type: none">- Characterization host.- Characterization stellar companion: physical asociation?	CAFOS	Low-resolution spectroscopy
III	<ul style="list-style-type: none">- Characterization star-planet and planet properties	CAFE	Stable, high-spectral resolution spectroscopy

IMAGING: False positives

False positives

a) Low-mass EB

b) Low-mass EB + backgr. object

c) Grazing eclipse

d) Background EB

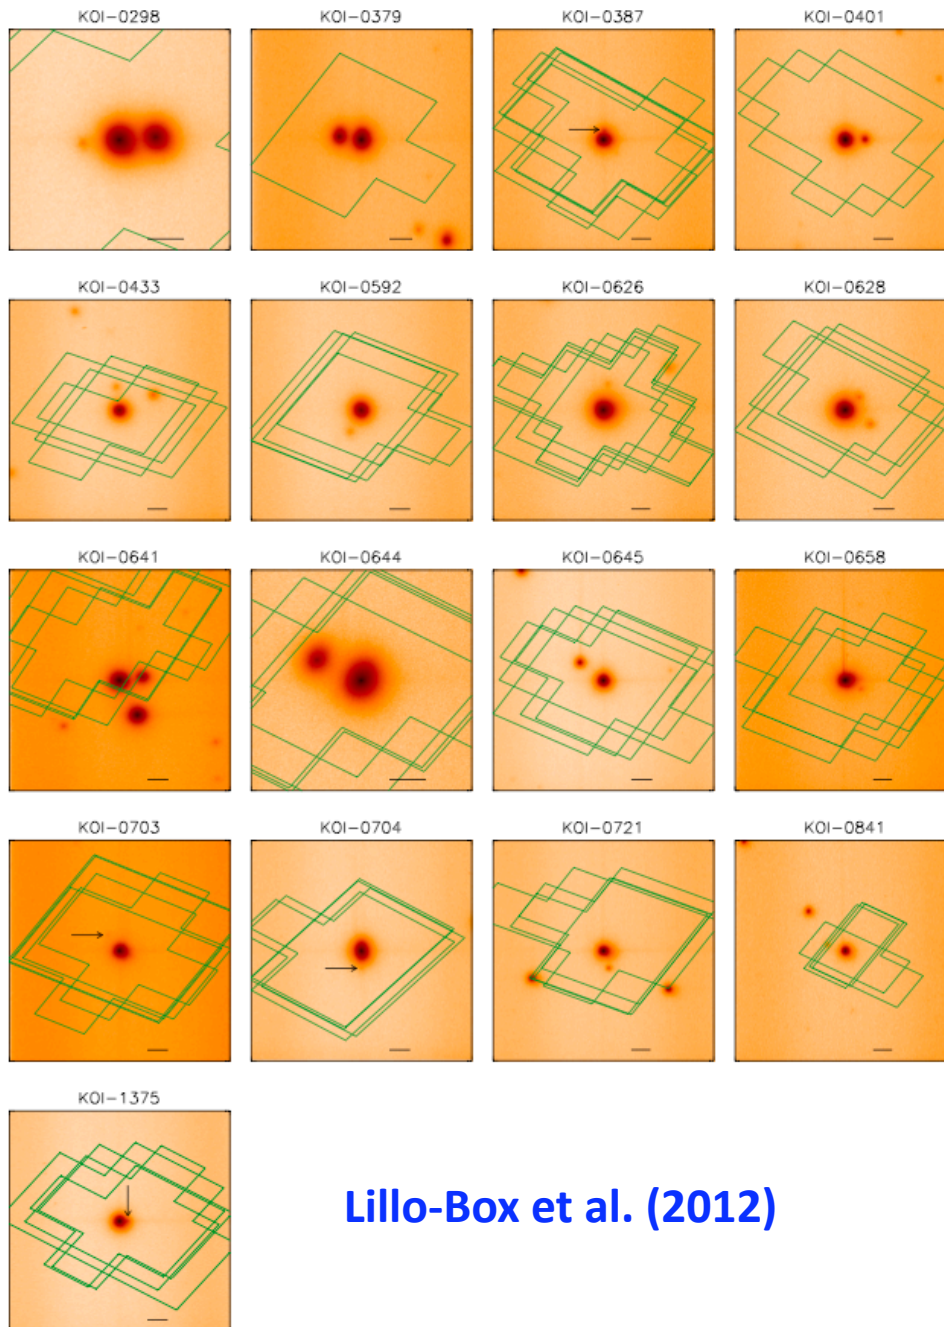

e) Background (larger) planet

f) Stellar spot

PHASE I: False positive detection (AstraLux)

Lillo-Box et al. (2012)

Conclusions

- 58% of the candidates isolated
- 17% w/ close companions

Implications

- New planet parameters needed for systems w/ close companions.
- 8 new possible bounded binary systems with planets.
- Improvement of the planet candidacy for 57-84 KOIs.

PHASE II: Host stellar properties (CAFOS)

KOI-0641

Observations

- Low-resolution spectroscopy for 29 KOIs and their large-separation companions (if any).
- Quasi-simultaneous R,I bands photometry for more than 40 KOIs with 3-6 arcsec companions to characterize their spectral types.

Goals

- Stellar characterization of the isolated parent stars and the large-separation companions.
- Reject other possible configurations that could mimic the planetary transit shape.

Configurations to be ruled out by Phase II

Grazing eclipse

Low-mass EB +
backgr. object

Low-mass EB

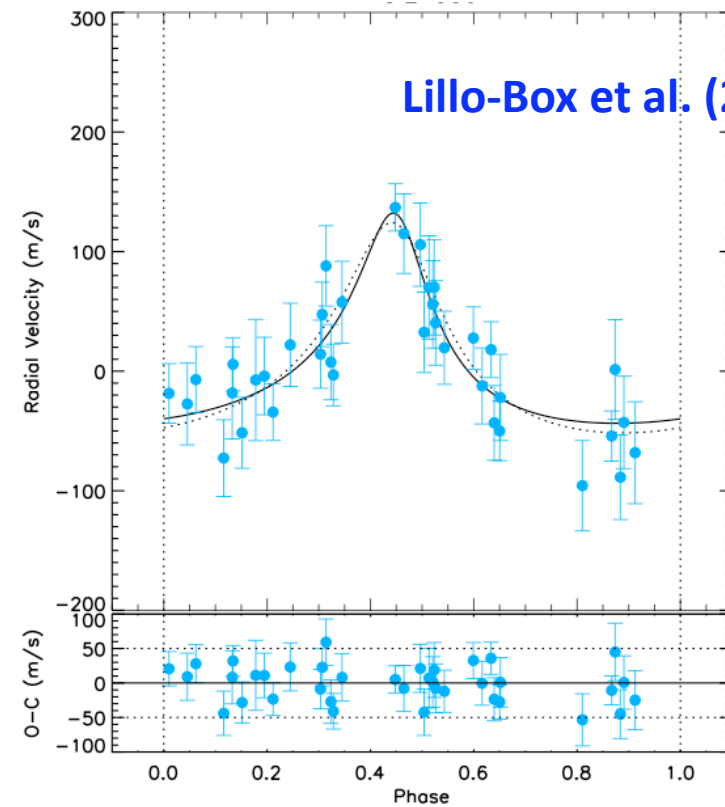

PHASE III: Planet characterization (CAFE)

Sample

- 23 planets being followed with CAFE.
- Periods ranging from 5 to 600 days.
- Mostly giant host stars.
- Neptune- and Jupiter-size candidates.

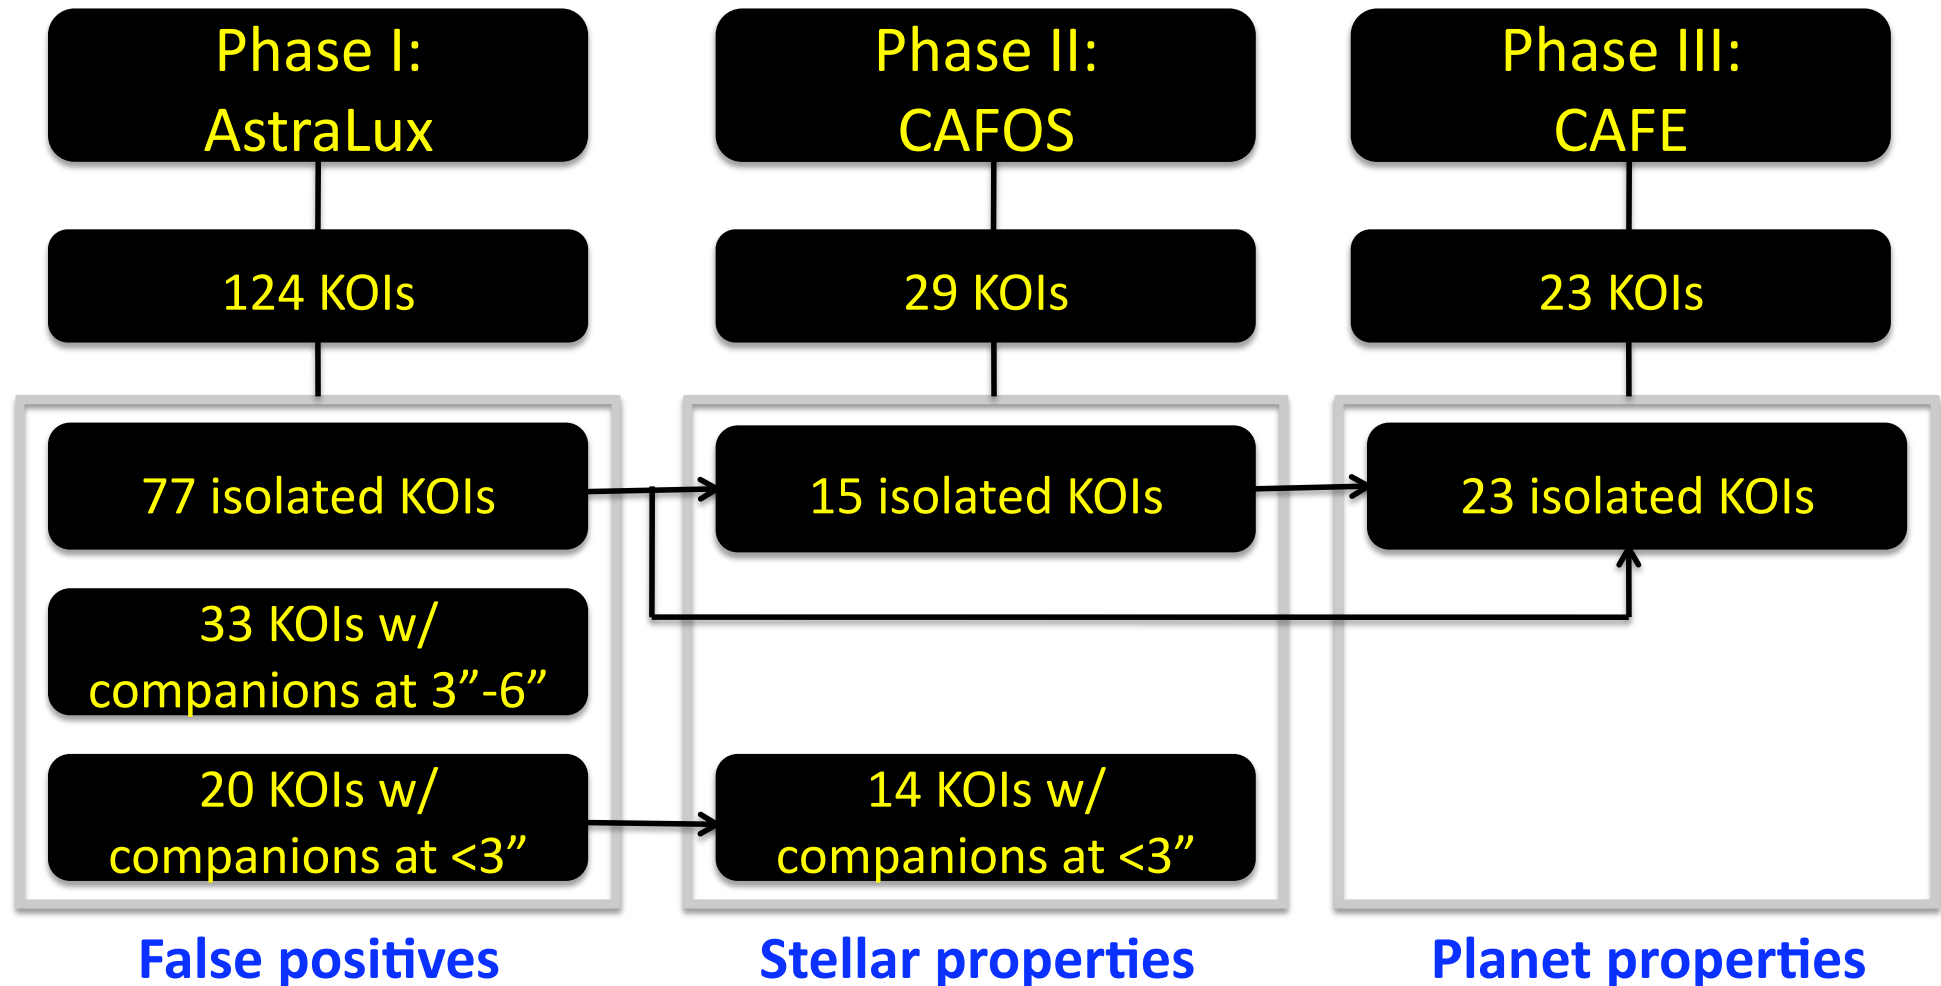

Lillo-Box et al. (2013), in prep.

Early results

- Confirmation and characterization of one planet candidate.
- Possible detection of a dense secondary inner planet
- Ongoing work for the confirmation of another 2-planetary system.

2nd Release (1235 planets around 997 stars)

A three phases study: from high spatial resolution imaging, to reject **false positives** and study **multiplicity of the host star**, to high-spectral resolution for RV (and **planet properties**)
