

# Cosmological constraints from all-sky X-ray surveys

Alexis Finoguenov  
CODEX & eROSITA collaboration

# Mapping the structure of the hot Universe

## By eROSITA

### Detect 100.000 Clusters of Galaxies

- ✓ All-sky survey sensitivity  $6 \times 10^{-14}$  erg/cm<sup>2</sup>/s
- ✓ Deep survey field(s) ( $\sim 100$  deg<sup>2</sup>) to  $1 \times 10^{-14}$
- ✓ Individual pointed observations
- ✓ Moderate angular resolution ( $< 30''$  aver. over FoV)
- ✓ Large collecting area ( $> 2000$  cm<sup>2</sup> @1keV)
- ✓ Large FoV ( $1^\circ$   $\emptyset$ )
- ✓ Long duration survey: 4 years  $\leftarrow \rightarrow$  1/2 year (ROSAT)

# eROSITA: cosmology-driven cluster detection

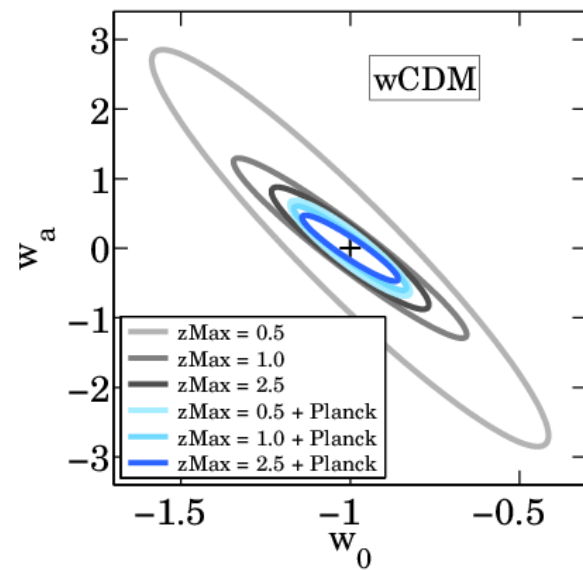

with Florian Kaefer

1. Based on experience with XMM surveys
2. Tuned for eROSITA using SIXTE simulations of AGNs+clusters
3. Goals: provide a physically motivated cluster detection, to ensure best cosmological performance
4. Improve the success of the cluster follow-up and calibration

# M-Lx relation

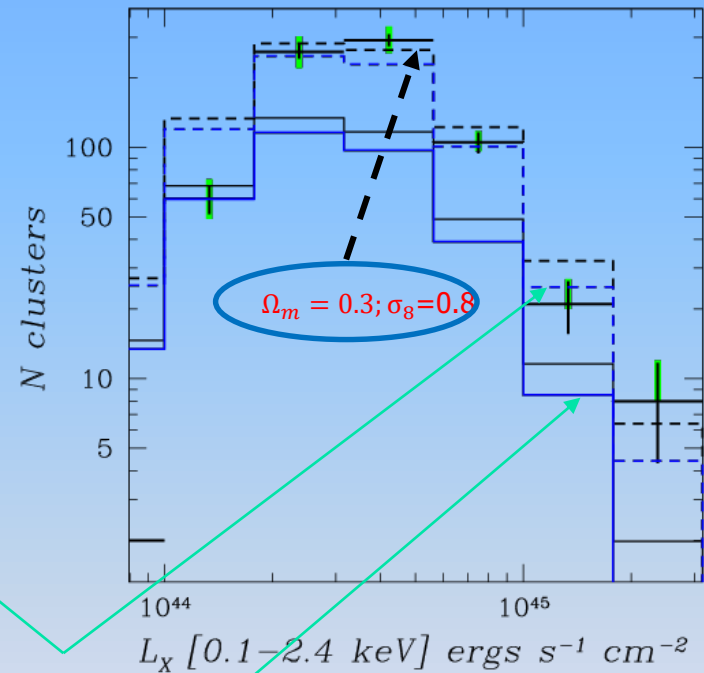

# Studying the covariance with richness: LoCuSS

At the same time relaxed clusters have higher  $L_x$  for a given mass => negative covariance is expected  
Farahi et al. in prep.

# Effect of covariance between richness and $L_x$

covariance

$$\mathcal{P}(\ell, t | \mu, z) = \frac{1}{2\pi R} e^{-\delta^T C^{-1} \delta}$$

With Fabrice Brimiouille, Nathalia Cibirka, Matteo Constanzi, Steffen Hagstotz

Nord et al. 2008

# Summary

---

- eROSITA will provide Stage IV FoM using spatially resolved core-excised cluster detection
- We identify a number of problems associated with RASS cluster catalogs:
  - Richness-dependent incompleteness
  - Richness-dependent AGN contamination
  - Covariance between richness and  $L_x$
  - Remaining inconsistencies in the cluster  $L_x$ -M calibration
