

Hemispherical Power Asymmetry in the Planck Data

Kristin Mikkelsen

Institute of Theoretical Astrophysics
University of Oslo

on behalf of the Planck Collaboration

04.04.2013

WMAP 1-year data

- 2003: First-year WMAP data released

WMAP 1-year data

- 2003: First-year WMAP data released
- 2004: Eriksen et al. suggest existence of a hemispherical power asymmetry

WMAP 1-year data

- 2003: First-year WMAP data released
- 2004: Eriksen et al. suggest existence of a hemispherical power asymmetry
 - Consider only large angular scales, $\ell < 40$

WMAP 1-year data

- 2003: First-year WMAP data released
- 2004: Eriksen et al. suggest existence of a hemispherical power asymmetry
 - Consider only large angular scales, $\ell < 40$
 - Find that Southern ecliptic hemisphere has more power than Northern

WMAP 3-year data

- 2005: Gordon et al. proposes dipolar modulation model

WMAP 3-year data

- 2005: Gordon et al. proposes dipolar modulation model
- 2007: Eriksen et al. fits this model to 3-year WMAP data.

WMAP 3-year data

- 2005: Gordon et al. proposes dipolar modulation model
- 2007: Eriksen et al. fits this model to 3-year WMAP data.
 - $A=0.114$

WMAP 3-year data

- 2005: Gordon et al. proposes dipolar modulation model
- 2007: Eriksen et al. fits this model to 3-year WMAP data.
 - $A=0.114$
 - $(l, b) = (225^\circ, -27^\circ)$ Ecliptic: $(\text{long, lat}) = (80^\circ, -45^\circ)$

WMAP 5-year data

- 2009: First high- ℓ asymmetry analysis by Hansen et al.

WMAP 5-year data

- 2009: First high- ℓ asymmetry analysis by Hansen et al.
 - Considered $\ell \leq 600$

WMAP 5-year data

- 2009: First high- ℓ asymmetry analysis by Hansen et al.
 - Considered $\ell \leq 600$
 - Independent estimates in bins of $\Delta\ell = 100$

WMAP 5-year data

- 2009: First high- ℓ asymmetry analysis by Hansen et al.
 - Considered $\ell \leq 600$
 - Independent estimates in bins of $\Delta\ell = 100$
 - Asymmetry observed in all ℓ bins

WMAP 5-year data

- 2009: First high- l asymmetry analysis by Hansen et al.
 - Considered $l \leq 600$
 - Independent estimates in bins of $\Delta l = 100$
 - Asymmetry observed in all l bins
 - High- l direction consistent with previous low- l results

WMAP 5-year data

- 2009: First high- l asymmetry analysis by Hansen et al.
 - Considered $l \leq 600$
 - Independent estimates in bins of $\Delta l = 100$
 - Asymmetry observed in all l bins
 - High- l direction consistent with previous low- l results
 - $(l, b) = (226^\circ, -17^\circ)$

WMAP 5-year data

- 2009: First high- l asymmetry analysis by Hansen et al.
 - Considered $l \leq 600$
 - Independent estimates in bins of $\Delta l = 100$
 - Asymmetry observed in all l bins
 - High- l direction consistent with previous low- l results
 - $(l, b) = (226^\circ, -17^\circ)$
 - A posteriori interpretation?

New results from Planck

- 2013: First Planck data release

New results from Planck

- 2013: First Planck data release
 - Different systematics

New results from Planck

- 2013: First Planck data release
 - Different systematics
 - Higher angular resolution and sensitivity

New results from Planck

- 2013: First Planck data release
 - Different systematics
 - Higher angular resolution and sensitivity
 - Larger effective multipole range

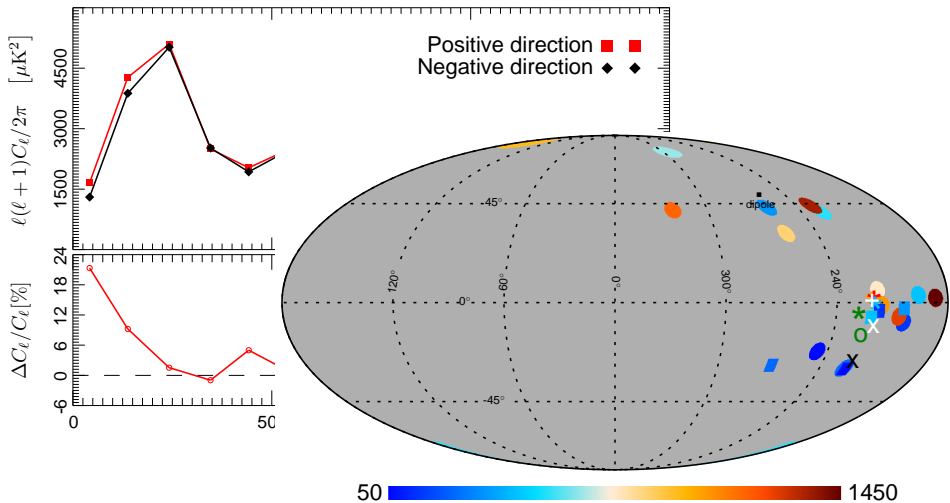

New results from Planck

- 2013: First Planck data release
 - Different systematics
 - Higher angular resolution and sensitivity
 - Larger effective multipole range
 - Improved foreground subtraction

New results from Planck

- 2013: First Planck data release
 - Different systematics
 - Higher angular resolution and sensitivity
 - Larger effective multipole range
 - Improved foreground subtraction
 - Larger sky fraction

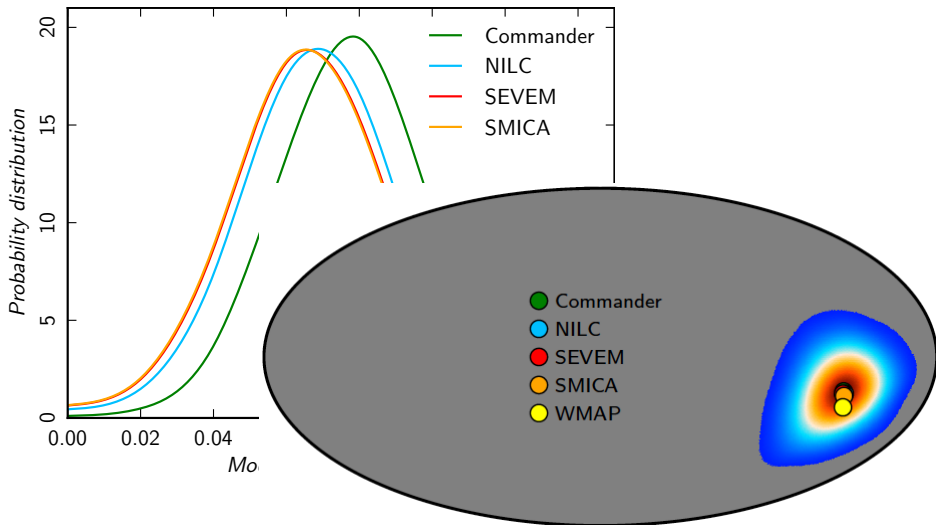

Planck high- ℓ resultsPower spectrum computed with $(l, b) = (224^\circ, 0^\circ)$ 

Planck high- ℓ results

Parametric dipolar model results

Parametric dipolar model results

BipoSH results

BipoSH results

Dipole

$$A = 0.078$$

$$(l, b) = (227^\circ, -15^\circ)$$

BipoSH

$$A = 0.072$$

$$(l, b) = (219^\circ, -21^\circ)$$

Conclusions

- Power asymmetry confirmed by Planck

Conclusions

- Power asymmetry confirmed by Planck
 - Visible up to at least $\ell \leq 1500$

Conclusions

- Power asymmetry confirmed by Planck
 - Visible up to at least $\ell \leq 1500$
 - Statistically significant at $\sim 3\sigma$ at low ℓ s

Conclusions

- Power asymmetry confirmed by Planck
 - Visible up to at least $\ell \leq 1500$
 - Statistically significant at $\sim 3\sigma$ at low ℓ s
 - Robust against systematics & foregrounds

Conclusions

- Power asymmetry confirmed by Planck
 - Visible up to at least $\ell \leq 1500$
 - Statistically significant at $\sim 3\sigma$ at low ℓ s
 - Robust against systematics & foregrounds
- A posteriori interpretation greatly weakened

Conclusions

- Power asymmetry confirmed by Planck
 - Visible up to at least $\ell \leq 1500$
 - Statistically significant at $\sim 3\sigma$ at low ℓ s
 - Robust against systematics & foregrounds
- A posteriori interpretation greatly weakened
 - Effect seen at ℓ s never before probed, with the same preferred direction as derived for $\ell < 40$
