Legacy: a 30 years tribute

EXOSAT 1983-1986

«This mission brought not only new capabilities that resulted in unexpected discoveries, but also a pioneering approach to operations and archiving that changed X-ray astronomy...»

The proven EXOSAT database system became the core of the HEASARC infrastructure. The HEASARC pioneered many concepts now taken for granted including standardized formats using FITS files, restoring data from earlier missions, multi-mission analysis tools and a searchable archive over the world wide web.»

Nicholas White (2013), AAS 221 113.18

Specific GUIs

What may remain for legacy

SCIOPS does not end with a data archive

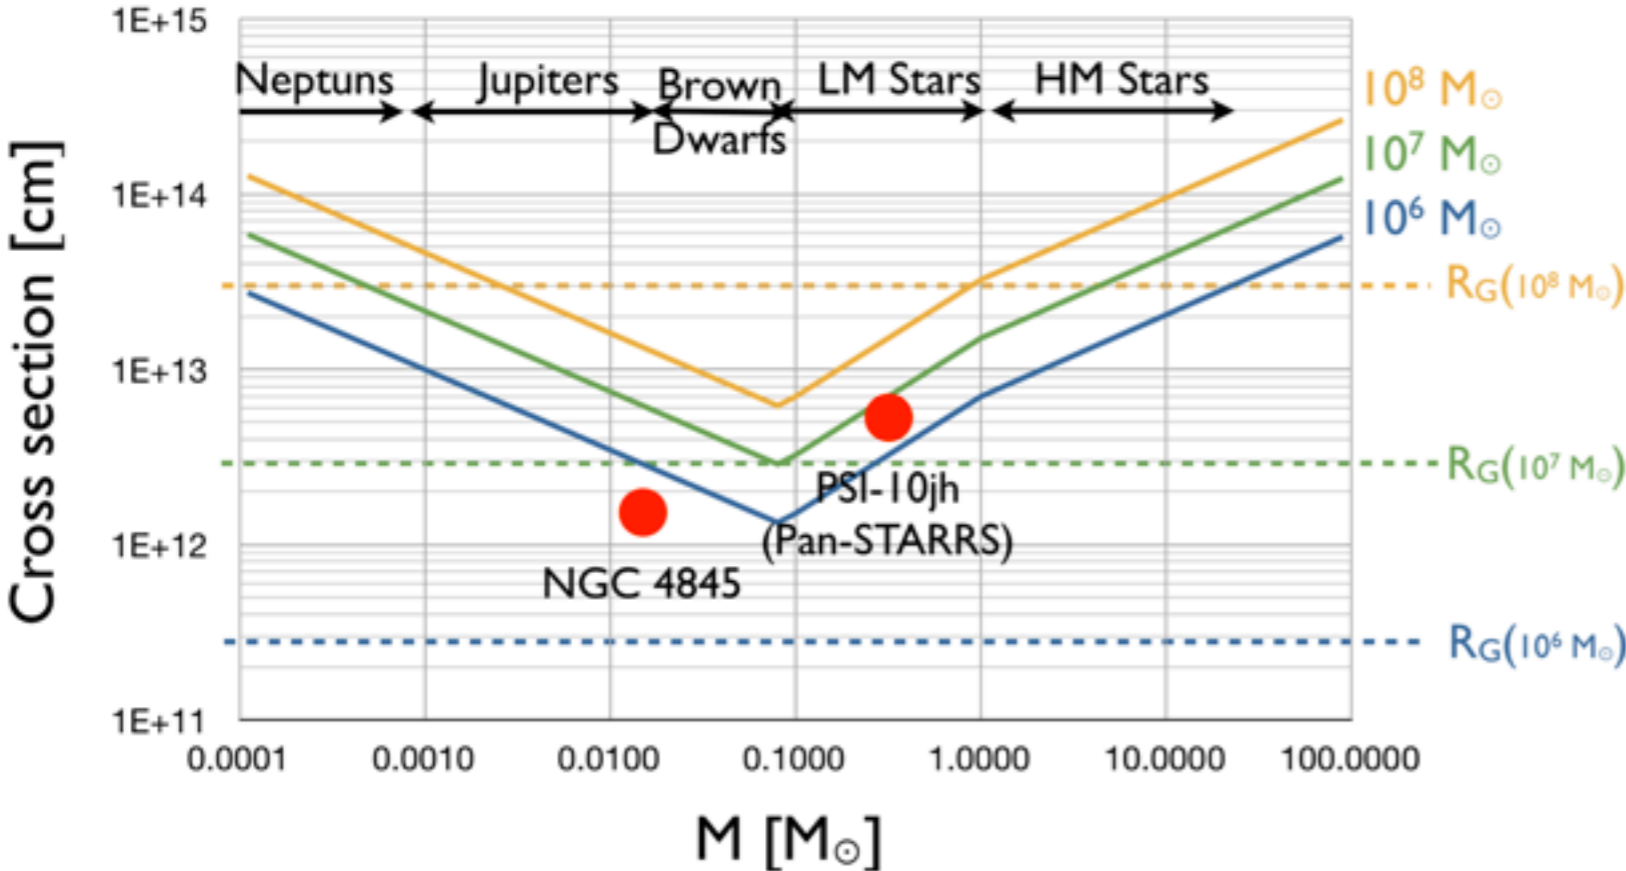

- Close to the end of a mission, detailed analysis knowledge vanishes. New potential users do not invest the resources to analyse data.
→ **Use of archival data should not require mission specific knowledge.**
- Pre-generated high-level products do not reflect the potential - nor the limitations - of an instrument.
→ **Need for generation of quality products tailored to the user's needs.**
- Archive users are not interested by observations but by sources.
→ **Products are needed for any sky position, time & energy interval.**

SCIOPS does not end with a data archive

Tidal disruption of a 15 Jupiter object by a $10^5 M_{\odot}$ black-hole in the core of NGC 4845

- ➔ Not detected by the Swift/BAT QLA
- ➔ Not detected by the Swift/BAT team
- ➔ Not among the standard products
- ➔ Not detectable by an archive user

Micro-lensing: unbound Jupiters are twice more common than MS stars (Sumi et al, 2011).

Solar-system formation: half of the planets are ejected (Veras et al, 2009)

HEAVENS (High-Energy Astrophysics Virtually ENlightened Sky)

- HEAVENS provides analysis services for a number of recent high-energy missions.
- HEAVENS allows users to generate **on-the-fly** and **straightforwardly** high-level products for any **sky position, time** and **energy intervals** without requiring mission specific software or detailed instrumental knowledge.
- HEAVENS extends some Virtual Observatory concepts from pre-generated products to on-the-fly analysis.
- HEAVENS makes the data and the process of generating science products available to higher education and the public.

HEAVENS: the GUI

The screenshot displays the HEAVENS web interface. At the top left is a logo with a tree and stars, and the title "HEAVENS". On the top right, there are utility icons (info, share, settings, search, user, help) and a "Basic | Advanced" toggle. The main form includes:

- Source name:** A text input with "Cyg X-1" and a dropdown menu "or select a famous object".
- or RA DEC:** Two text input fields and a dropdown menu "Equatorial FK5".
- Time interval:** Two text input fields and a dropdown menu "MJD (TT)".
- Instrument Selection:** A row of checkboxes for various instruments: Planck, INTEGRAL OMC, XMM-Newton EPIC, RXTE ASM, INTEGRAL JEM-X, **RXTE PCA** (highlighted in red), INTEGRAL ISGRI, INTEGRAL PICsIT, INTEGRAL SPI, INTEGRAL SPI ACS, FERMI LAT, HEGRA, and INTEGRAL IREM.
- Lightcurve:** A checked checkbox "Lightcurve with a bin size of 1 hours" and an "Energy band [keV]: 2.0-50.0" dropdown. Below it, "Min - Max: 0.2 75.0" with two dropdowns.
- Source and/or background:** Radio buttons for "source + background", "background", and "source" (selected).
- Spectrum:** A checked checkbox.
- Proportional Counter Unit:** Radio buttons for 0, 1, 2 (selected), 3, and 4.
- Layer(s):** Radio buttons for "top" (selected) and "all".

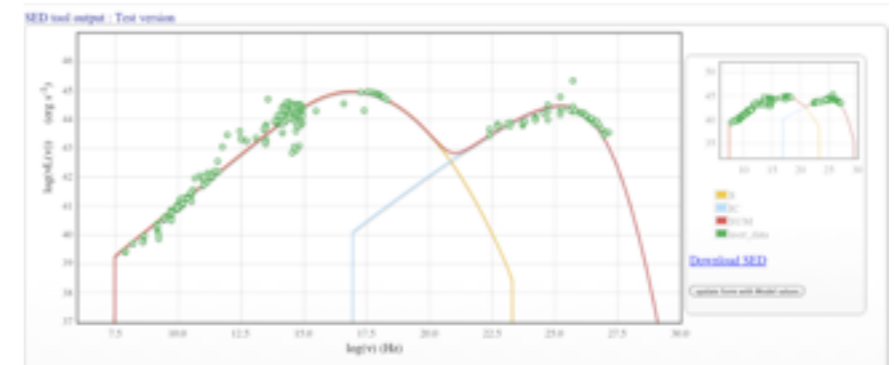

At the bottom, there are "Submit" and "Reset" buttons.

HEAVENS: how it works

Redesigning iSDC: Quick-Look Analysis

- **Quick-look analysis** can be performed by observers (and the community at large) through an HEAVENS interface. The observer could be virtually sitting in the data center and access data in near real time, at any time.
- **Scientists on duty** could be scattered around the world, keeping all involved partners (instr teams) in science operations.

Redesigning iSDC: Observatory Operations

- **Standard analysis** can also be made available through an HEAVENS interface (important for missions with large data sets).
- Move from distributing data and software to **distributing services**.
- Thanks to the **distributed architecture**, services can be offered/maintained by various partners.
- Services can easily be moved.

Distributed On-the-Fly Data Processing Archives

- Same interface from QLA to post mission archive
- Observers virtually sitting at the SOC/SDC
- Data competition → easier collaboration
- Keep analysis flexibility long after the mission
- Small s/w overhead on top of essential analysis tools and data

When designing SCIOPS, start by thinking about legacy !
